What if you don't have a high quality reference genome sequence?

Genome-free de novo transcript reconstruction to the rescue.

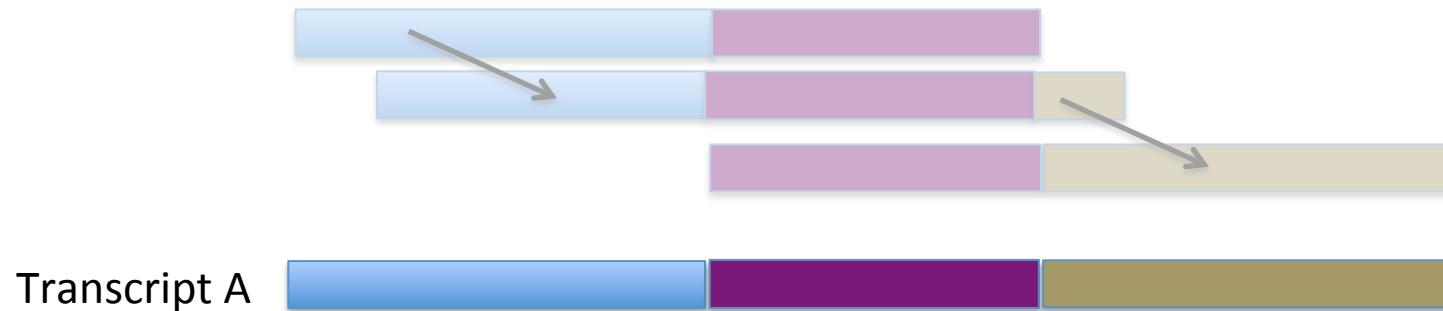

Read Overlap Graph: Reads as nodes, overlaps as edges

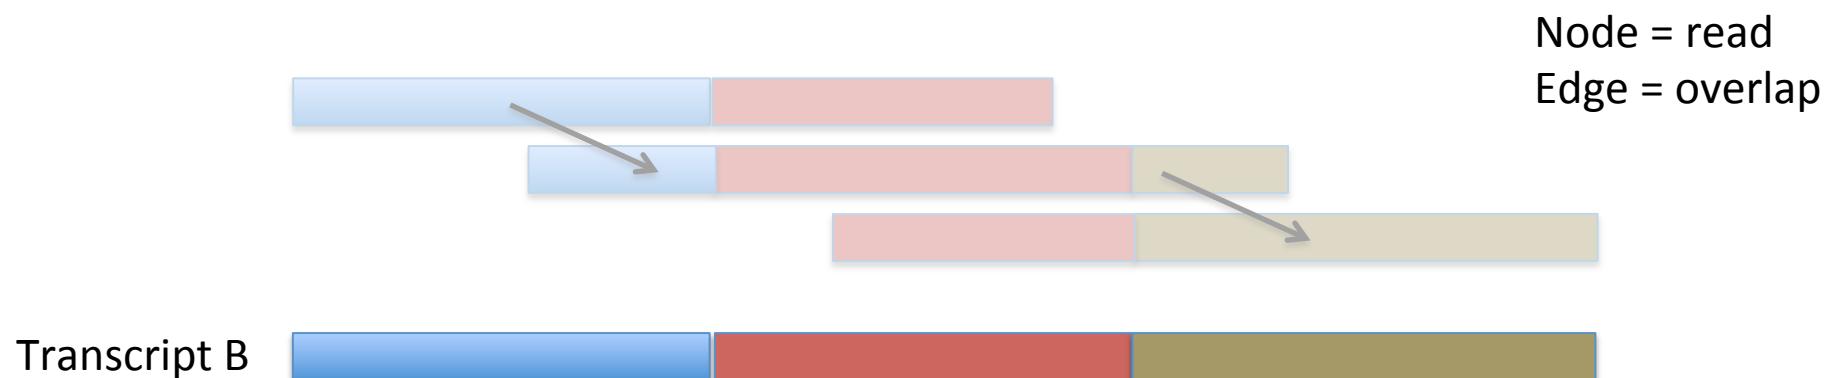

Read Overlap Graph: Reads as nodes, overlaps as edges

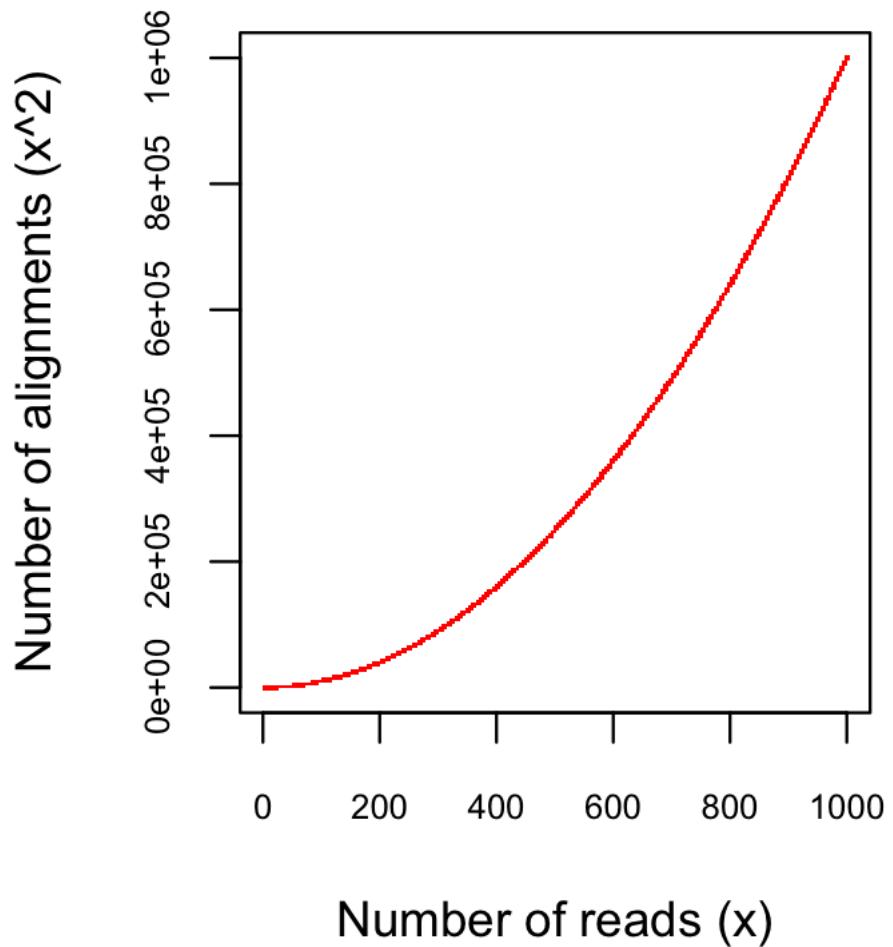

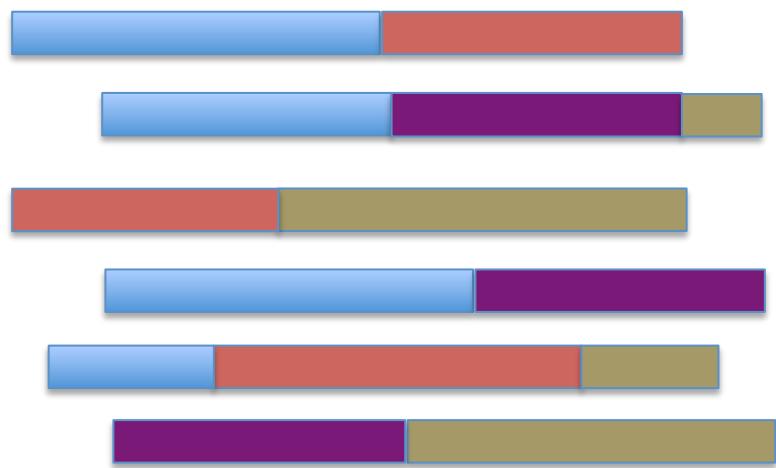

Read Overlap Graph: Reads as nodes, overlaps as edges

Generate consensus sequence where reads overlap

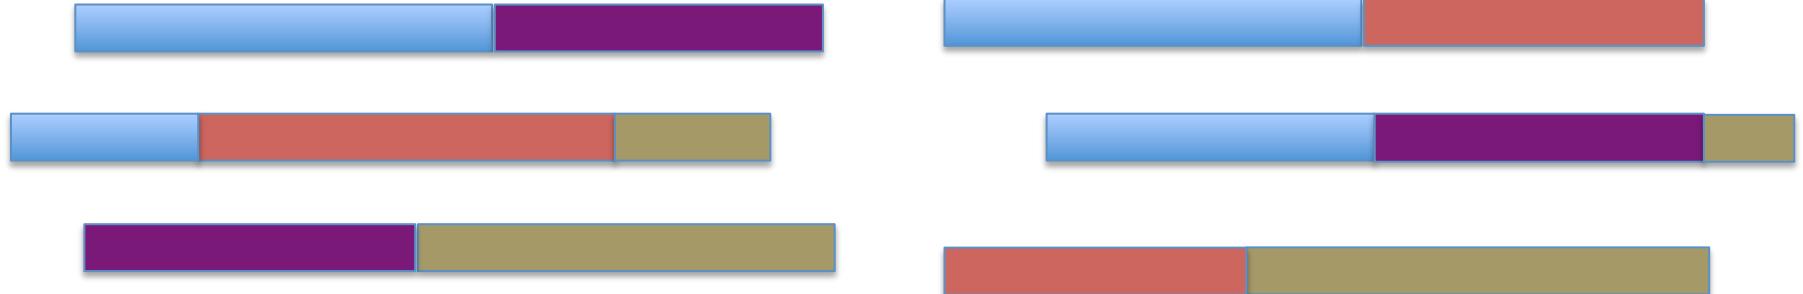

Finding pairwise overlaps between n reads involves $\sim n^2$ comparisons.

Impractical for typical RNA-Seq data (50M reads)

No genome to align to... De novo assembly required

Want to avoid n^2 read alignments to define overlaps

Use a de Bruijn graph

Sequence Assembly via de Bruijn Graphs

Generate all substrings of length k from the reads

Sequence Assembly via De Bruijn Graphs

Generate all substrings of length k from the reads

Sequence Assembly via De Bruijn Graphs

Generate all substrings of length k from the reads

Construct the de Bruijn graph

Nodes = unique k-mers

Strand-specific RNA-Seq is Preferred

Computationally: fewer confounding graph structures in de novo assembly:
ex. Forward != reverse complement
(GGAA != TTCC)

Biologically: separate sense vs. antisense transcription

NATURE METHODS | VOL.7 NO.9 | SEPTEMBER 2010 |  BROAD
INSTITUTE

Comprehensive comparative analysis of strand-specific RNA sequencing methods

Joshua Z Levin^{1,6}, Moran Yassour^{1-3,6}, Xian Adiconis¹, Chad Nusbaum¹, Dawn Anne Thompson¹, Nir Friedman^{3,4}, Andreas Gnirke¹ & Aviv Regev^{1,2,5}

Strand-specific, massively parallel cDNA sequencing (RNA-seq) is a powerful tool for transcript discovery, genome annotation

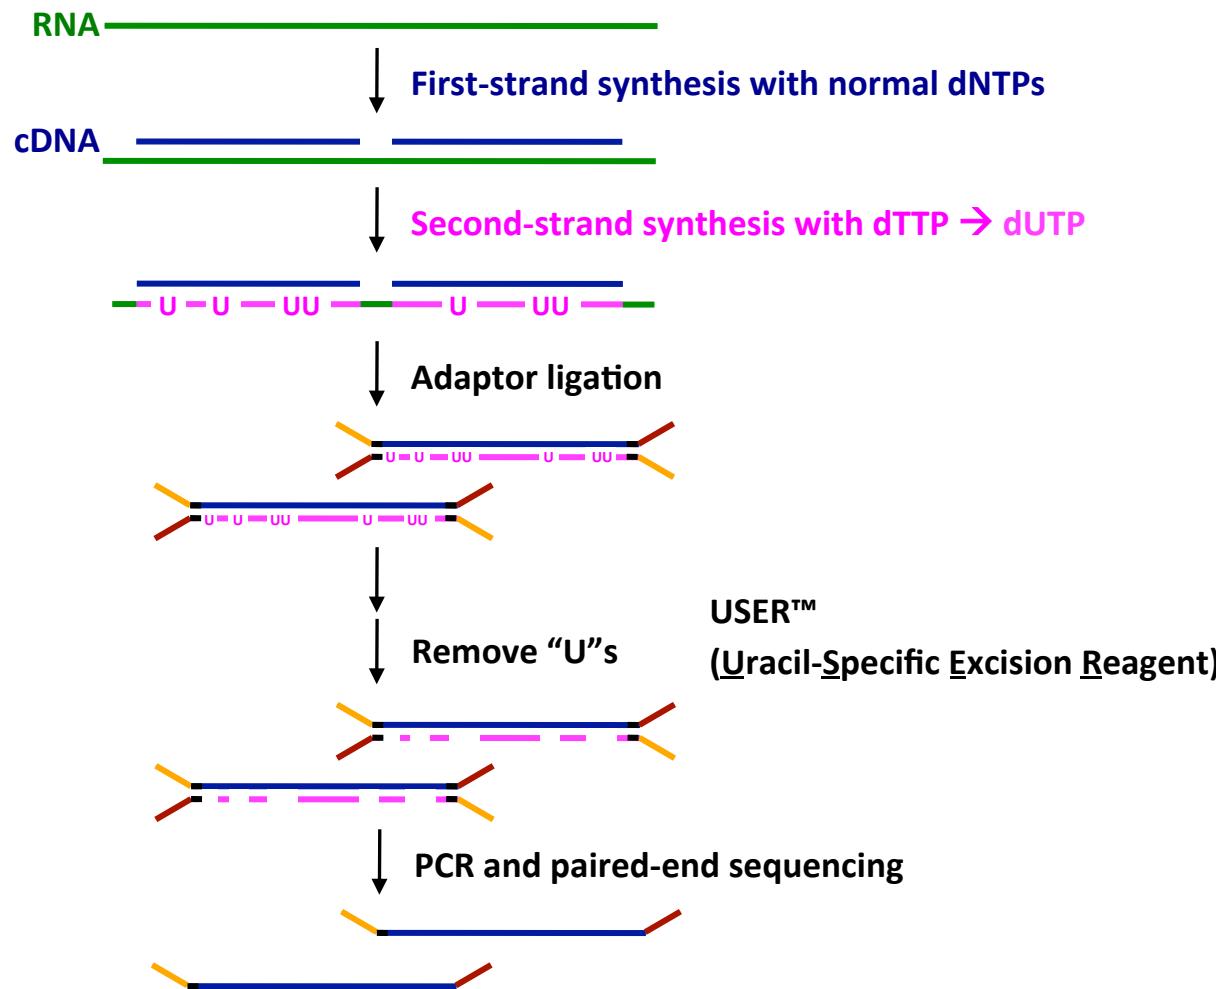

Nevertheless, direct information on the originating strand can substantially enhance the value of an RNA-seq experiment. For

'dUTP second strand marking' identified as the leading protocol

to choose between them. Here we developed a comprehensive computational pipeline to compare library quality metrics from any RNA-seq method. Using the well-annotated *Saccharomyces cerevisiae* transcriptome as a benchmark, we compared seven library-construction protocols, including both published and

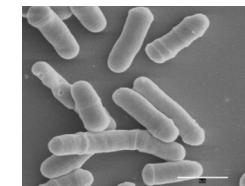

transcribed strand or other noncoding RNAs; determine the exact boundaries of adjacent genes transcribed on opposite strands and resolve the correct expression levels of coding or noncoding overlapping transcripts. These tasks are particularly challenging in small microbial genomes, prokaryotic and eukaryotic, in which

IGV

www.broadinstitute.org/igv/

The screenshot shows the IGV website at www.broadinstitute.org/igv/. The page features a large central image of the IGV software interface, which displays multiple tracks of genomic data including tracks for chromosomes, gene models, and sequencing reads. To the left of the main content area is a sidebar with the IGV logo and a navigation menu. The menu includes links for Home, Downloads, Documents, Hosted Genomes, FAQ, IGV User Guide, File Formats, Release Notes, Credits, and Contact. Below the menu is a search bar labeled "Search website" with a "search" button. At the bottom of the sidebar, there are links to the Broad Home and Cancer Program websites, and the text "© 2012 Broad Institute".

Integrative Genomics Viewer

What's New

NEWS

July 3, 2012. Soybean (*Glycine max*) and Rat (*rn5*) genomes have been updated.

April 20, 2012. IGV 2.1 has been released.
See the [release notes](#) for more details.

April 19, 2012. See our new [IGV paper](#) in *Briefings in Bioinformatics*.

Overview

Citing IGV

To cite your use of IGV in your publication:

James T. Robinson, Helga Thorvaldsdóttir, Wendy Winckler, Mitchell Guttman, Eric S. Lander, Gad Getz, Jill P. Mesirov. [Integrative Genomics Viewer. Nature Biotechnology 29, 24–26 \(2011\)](#), or

Can Examine Transcript Read Support Using IGV

Can align Trinity transcripts to genome scaffolds to examine intron/exon structures

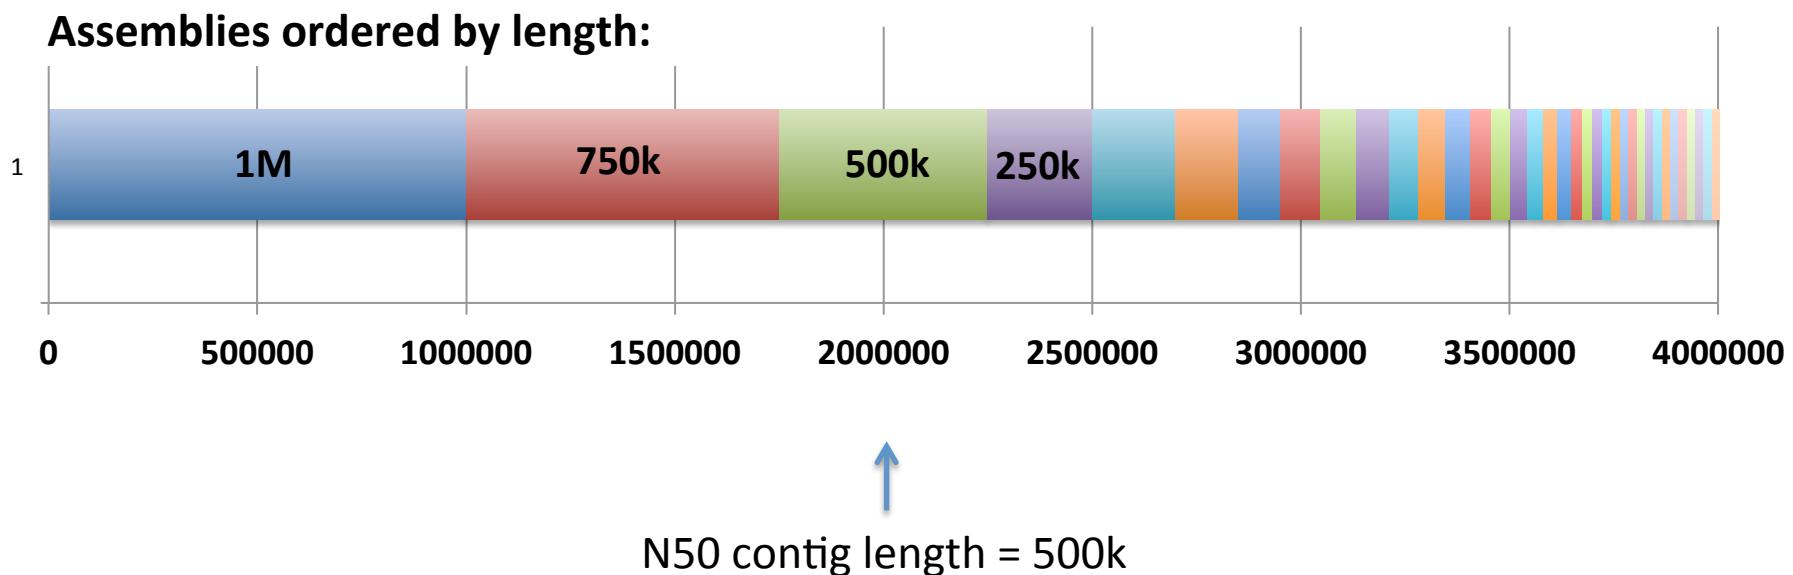

(Trinity transcripts aligned to the genome using GMAP)

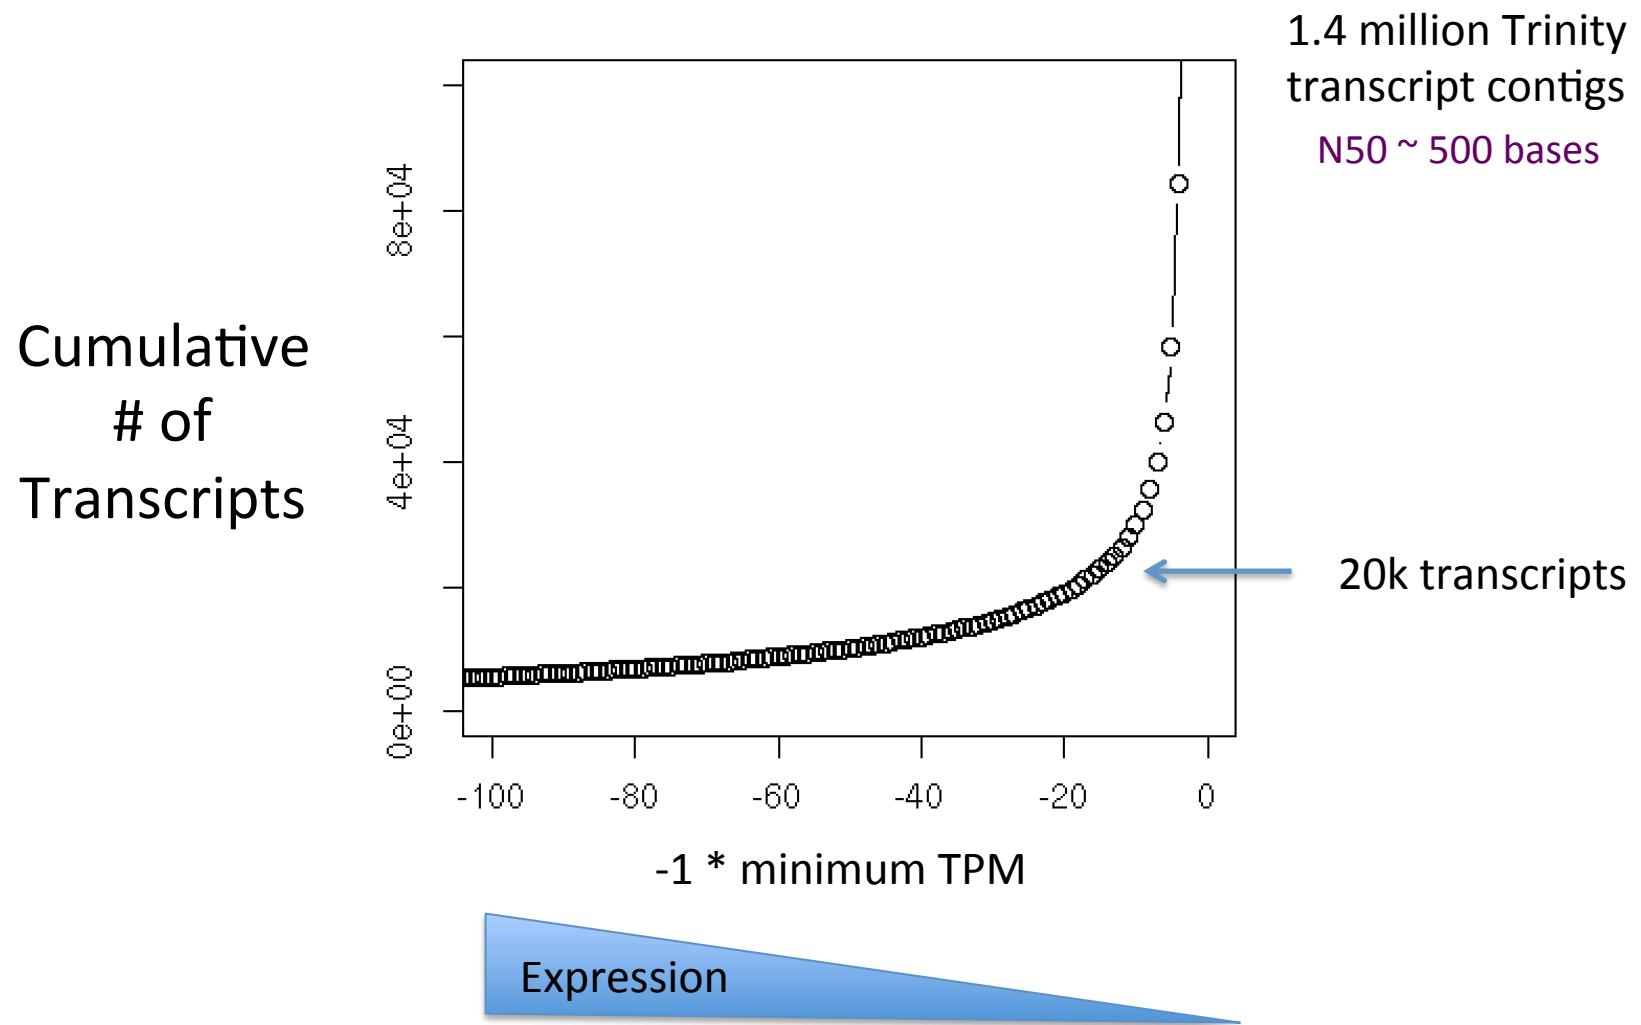

The Contig N50 statistic

“At least half of assembled bases are in contigs that are at least **N50** bases in length”

In genome assemblies – used often to judge ‘which assembly is better’

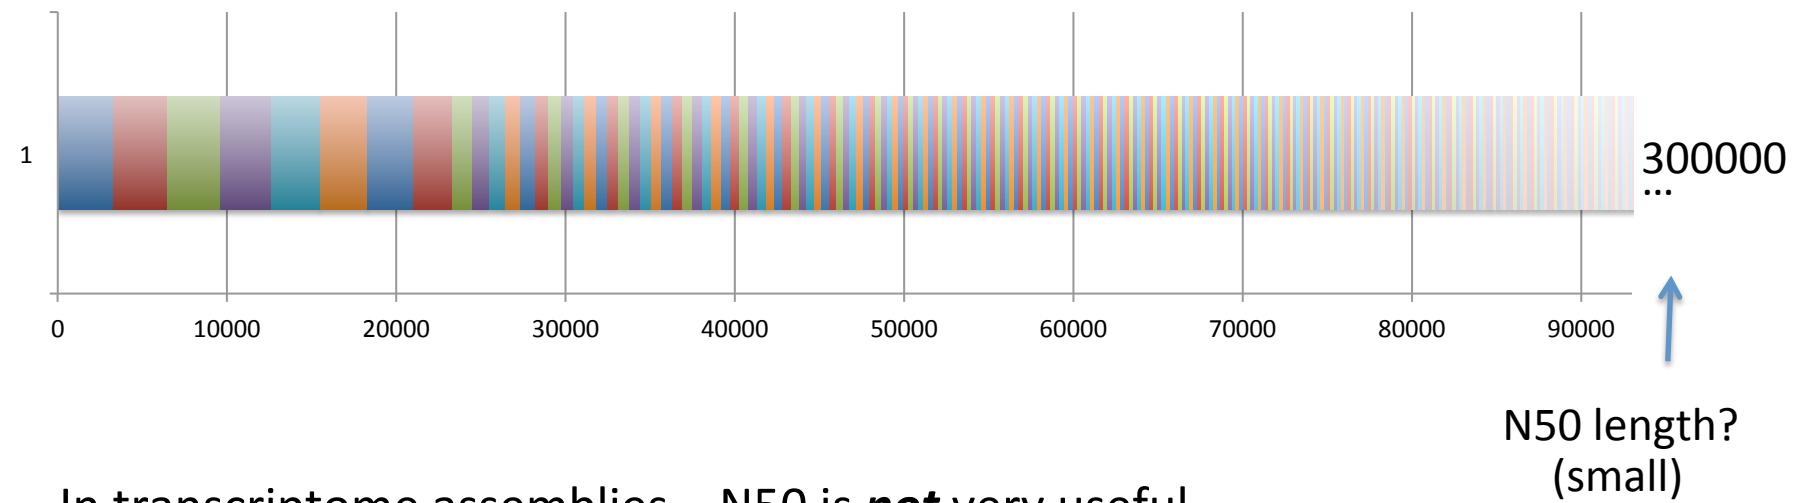

Often, most assembled transcripts are *very* lowly expressed
(How many ‘transcripts & genes’ are there really?)

* Salamander transcriptome

N50 Calculation for *Transcriptome* Assemblies??

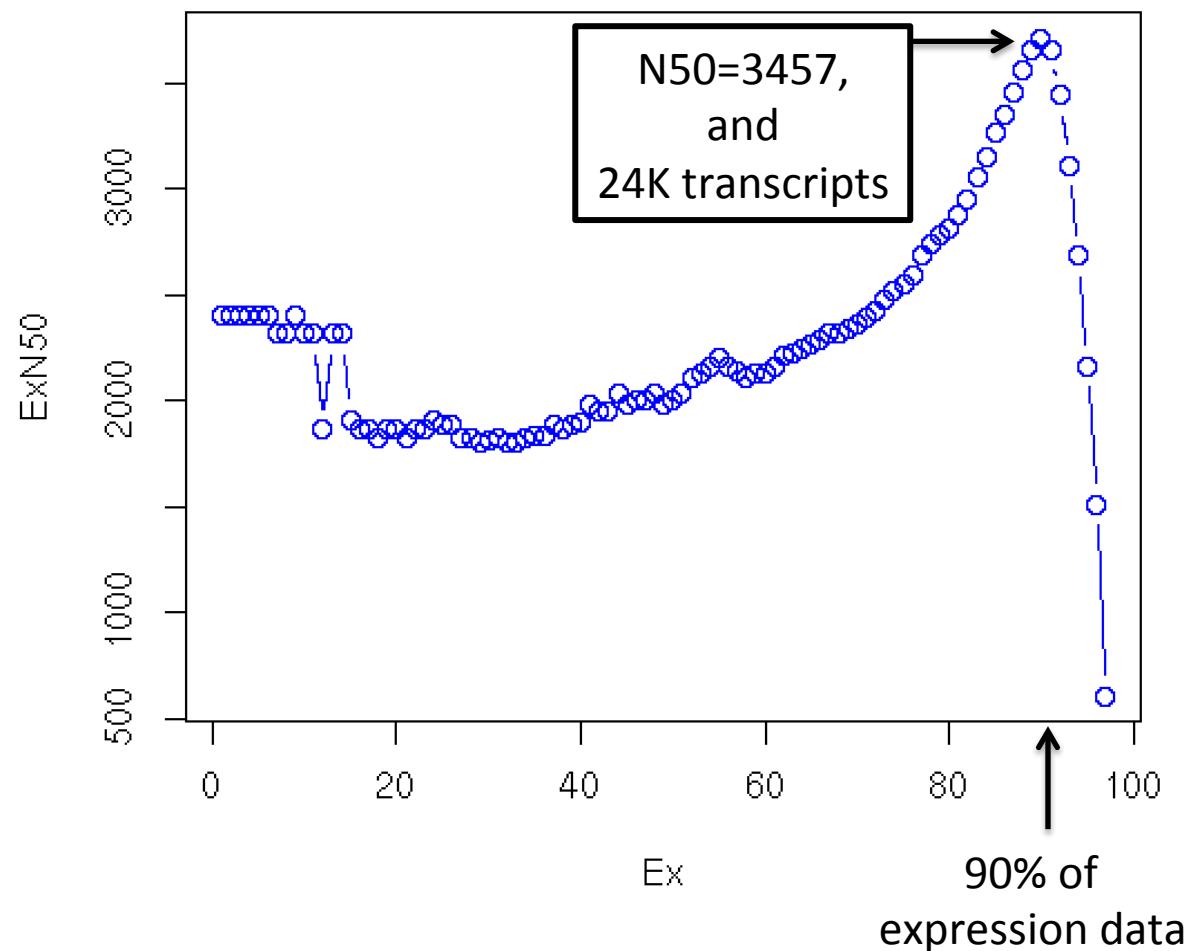

In transcriptome assemblies – N50 is *not* very useful.

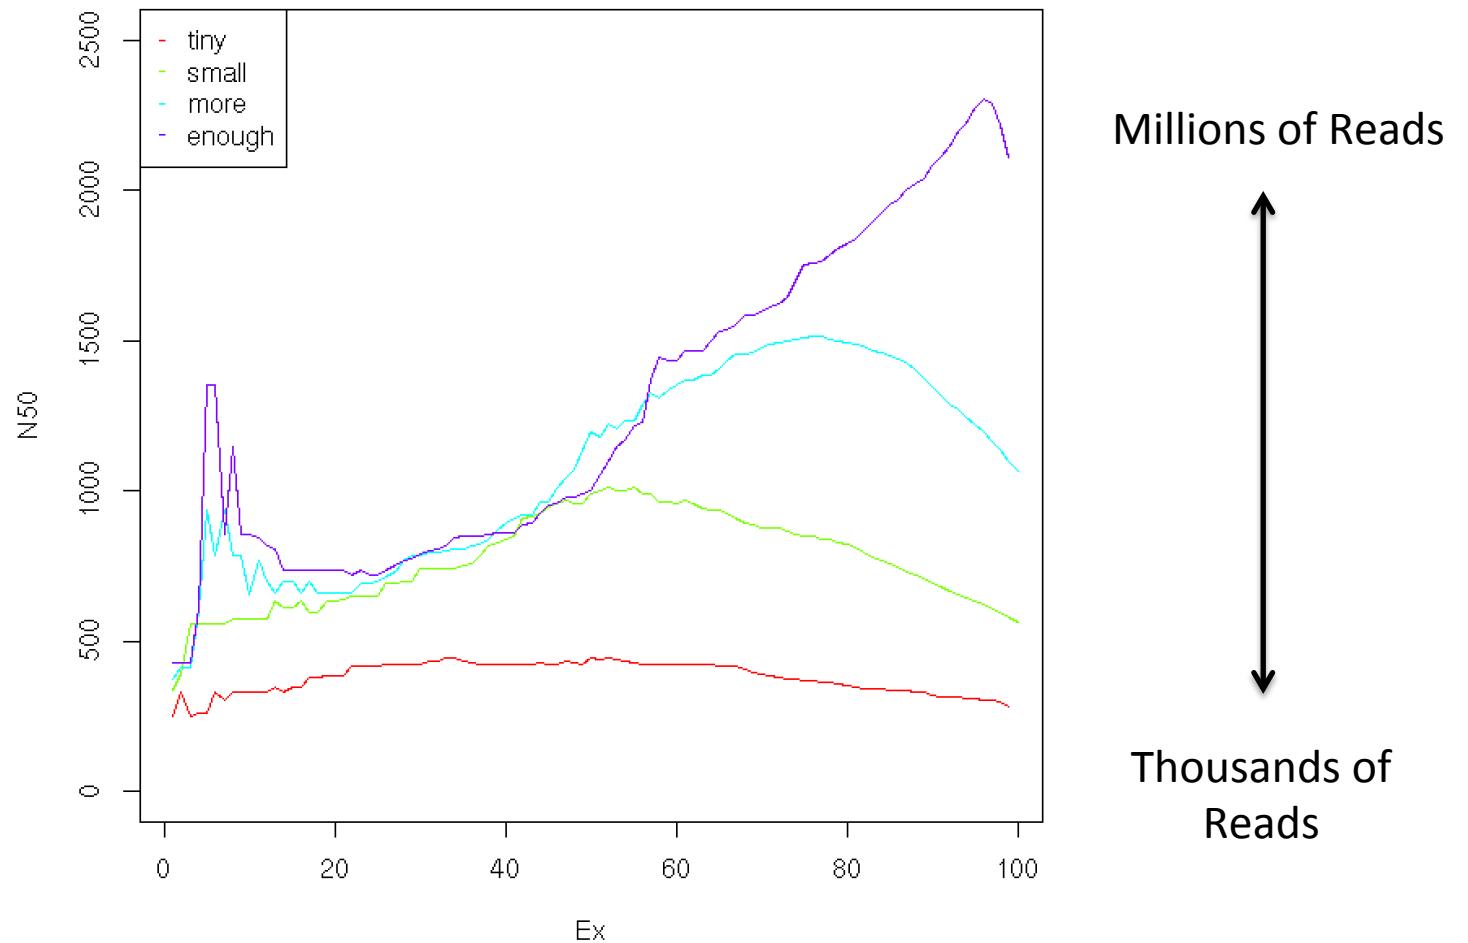

- Overzealous isoform annotation for long transcripts drives higher N50
- Very sensitive reconstruction for short lowly expressed transcripts drives lower N50

Compute N50 Based on the Top-most Highly Expressed Transcripts (ExN50)

- Sort contigs by expression value, descendingly.
- Compute N50 given minimum % total expression data thresholds => ExN50

ExN50 Profiles for Different Trinity Assemblies Using Different Read Depths

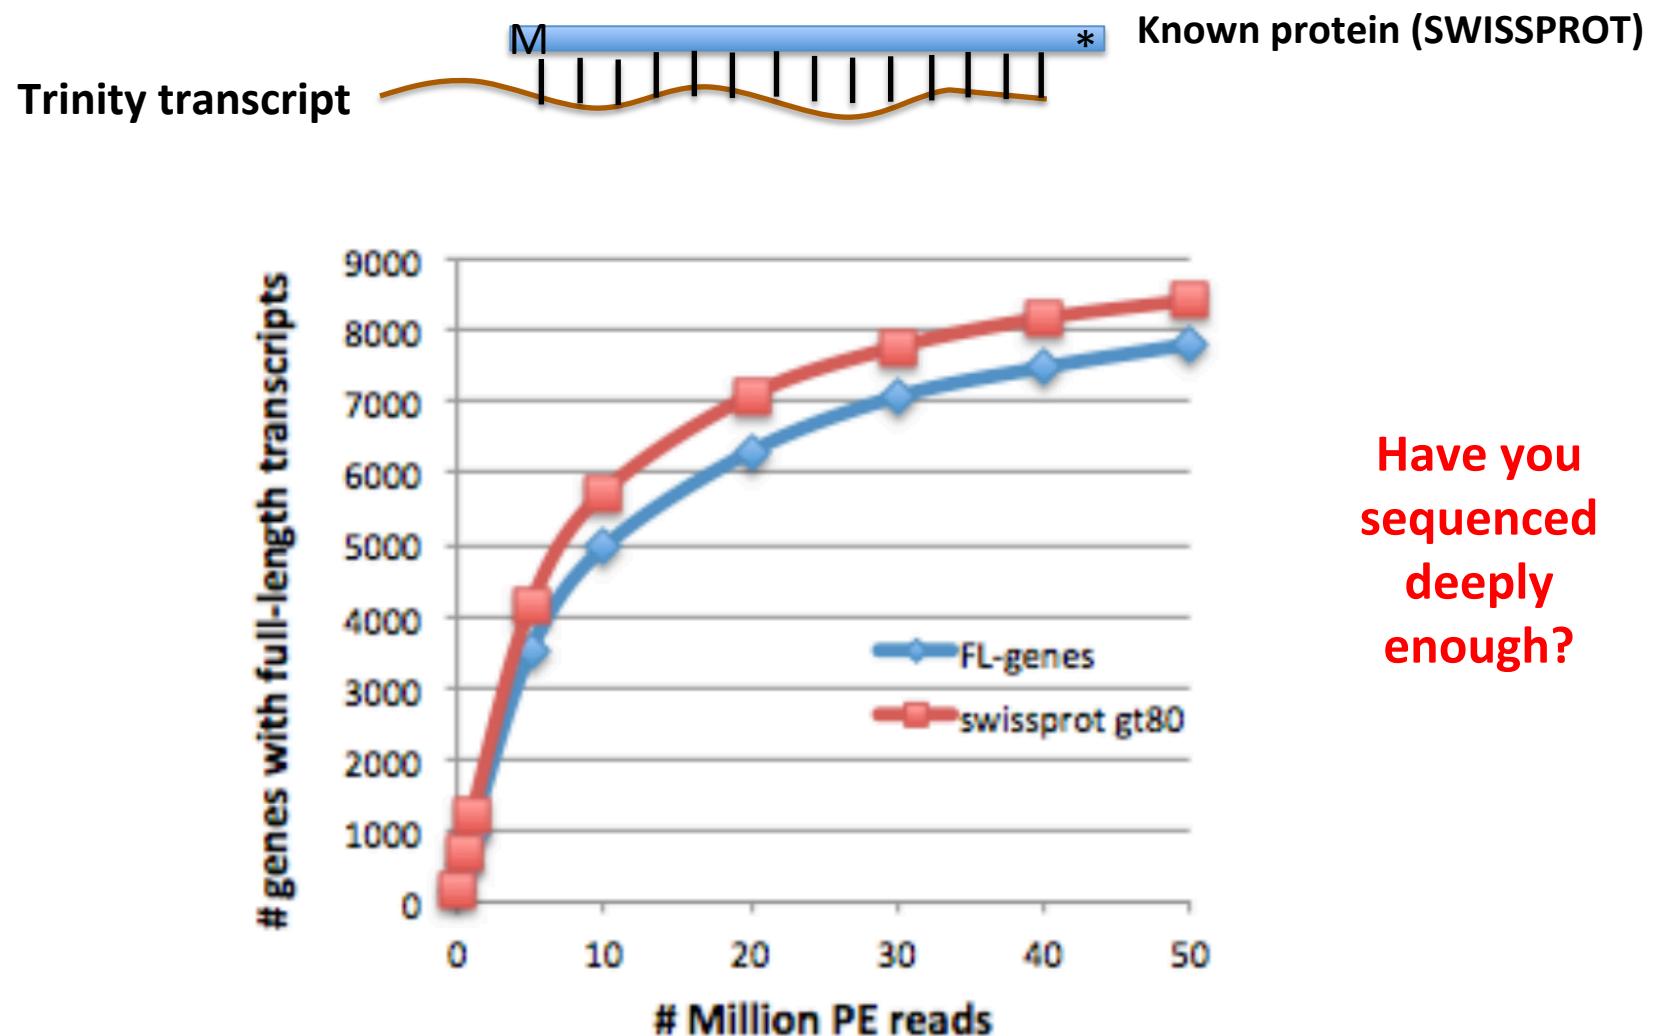

Note shift in ExN50 profiles as you assemble more and more reads.

* Candida transcriptome

Evaluating the quality of your transcriptome assembly

Full-length Transcript Detection via BLASTX

deeply
enough?

Assessing genome assembly and annotation completeness with Benchmarking Universal Single-Copy Orthologs

About BUSCO

BUSCO v2 provides quantitative measures for the assessment of genome assembly, gene set, and transcriptome completeness, based on evolutionarily-informed expectations of gene content from near-universal single-copy orthologs selected from [OrthoDB v9](#).

BUSCO assessments are implemented in open-source software, with a large selection of lineage-specific sets of Benchmarking Universal Single-Copy Orthologs. These conserved orthologs are ideal candidates for large-scale phylogenomics studies, and the annotated BUSCO gene models built during genome assessments provide a comprehensive gene predictor training set for use as part of genome annotation pipelines.

Assessing genome assembly and
annotation completeness with
Benchmarking Universal Single-
Copy Orthologs

```
#Summarized BUSCO benchmarking for file: Trinity.fasta
#BUSCO was run in mode: trans
```

Summarized benchmarks in BUSCO notation:

C:88%[D:53%],F:4.5%,M:7.3%,n:3023

Representing:

- 1045 Complete Single-copy BUSCOs
- 1617 Complete Duplicated BUSCOs
- 139 Fragmented BUSCOs
- 222 Missing BUSCOs
- 3023 Total BUSCO groups searched

Detonate: Which assembly is better?

“RSEM-EVAL [sic] uses a novel probabilistic model-based method to compute the joint probability of both an assembly and the RNA-Seq data as an evaluation score.”

$$\text{score}_{\text{RSEM-EVAL}}(A) = \log P(A, D)$$

“the RSEM-EVAL score of an assembly is defined as the log joint probability of the assembly A and the reads D used to construct it”

$$\begin{aligned} \log P(A, D) &= \log \int_{\Lambda} P(D|A, \Lambda)P(A|\Lambda)P(\Lambda)d\Lambda \\ &\approx \underbrace{\log P(D|A, \Lambda_{\text{MLE}})}_{\text{likelihood}} + \underbrace{\log P(A|\Lambda_{\text{MLE}})}_{\text{assembly prior}} \\ &\quad - \underbrace{\frac{1}{2}(M+1)\log N}_{\text{BIC penalty}}, \end{aligned}$$

Detonate: Which assembly is better?

“RSEM-EVAL [sic] uses a novel probabilistic model-based method to compute the joint probability of both an assembly and the RNA-Seq data as an evaluation score.”

$$\text{score}_{\text{RSEM-EVAL}}(A) = \log P(A, D)$$

“the RSEM-EVAL score of an assembly is defined as the log joint probability of the assembly A and the reads D used to construct it”

$$\begin{aligned} \log P(A, D) &= \log \int_{\Lambda} P(D|A, \Lambda)P(A|\Lambda)P(\Lambda)d\Lambda \\ &\approx \underbrace{\log P(D|A, \Lambda_{\text{MLE}})}_{\text{likelihood}} + \underbrace{\log P(A|\Lambda_{\text{MLE}})}_{\text{assembly prior}} \end{aligned}$$

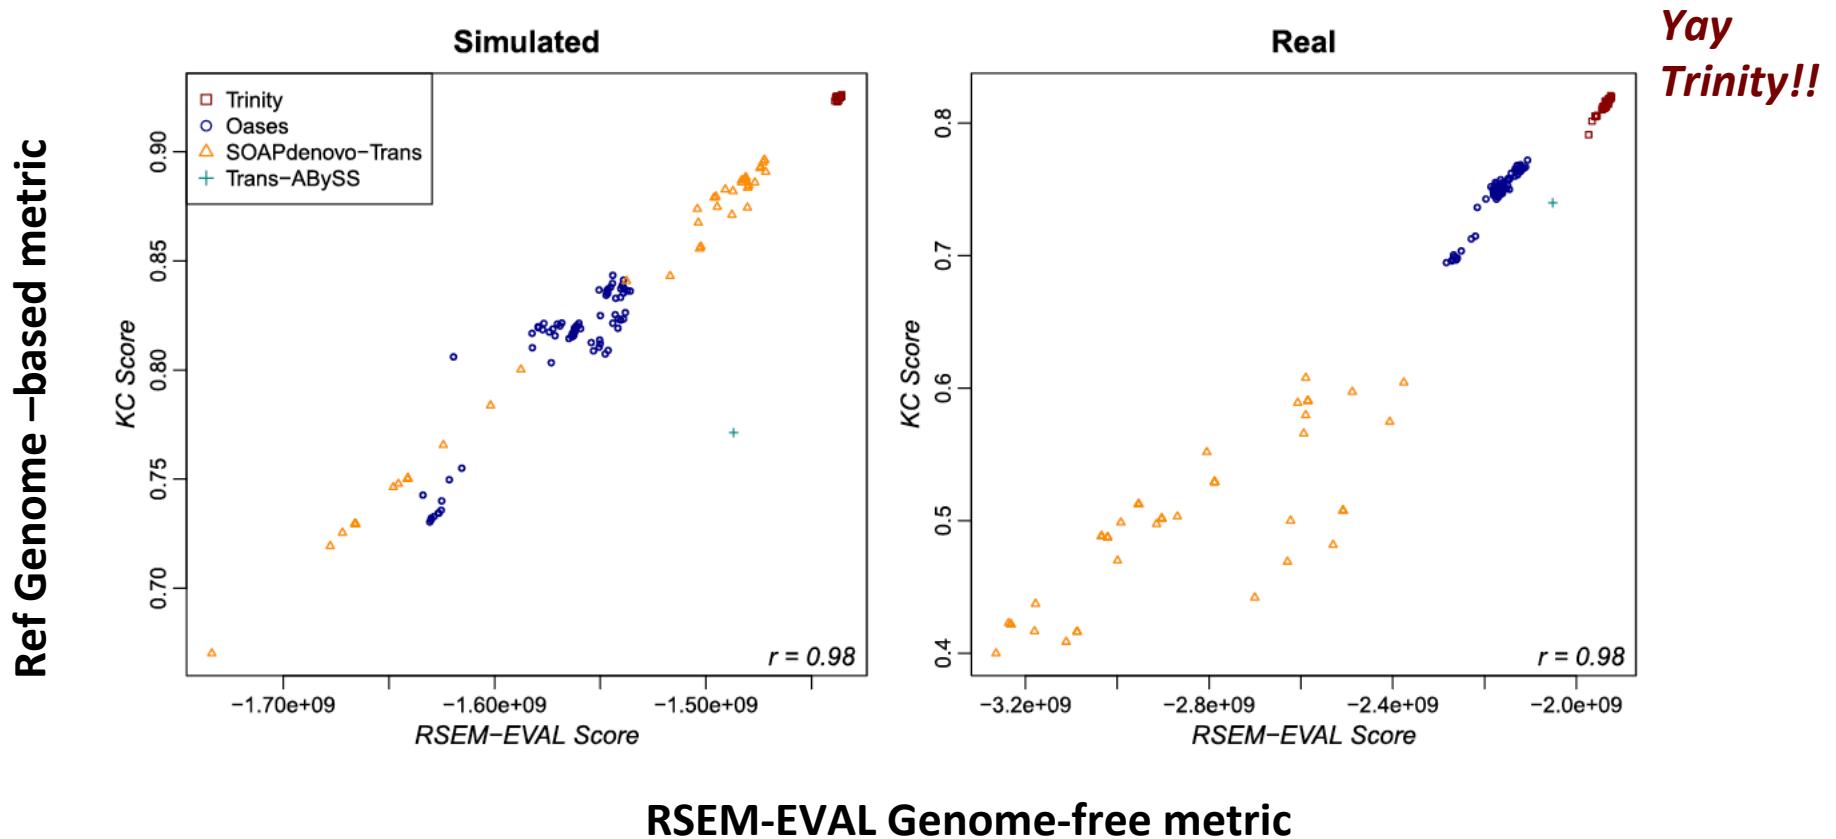

Bigger Score = Better Assembly

$$-\frac{1}{2}(M+1)\log N,$$

BIC penalty

Detonate: Which assembly is better?

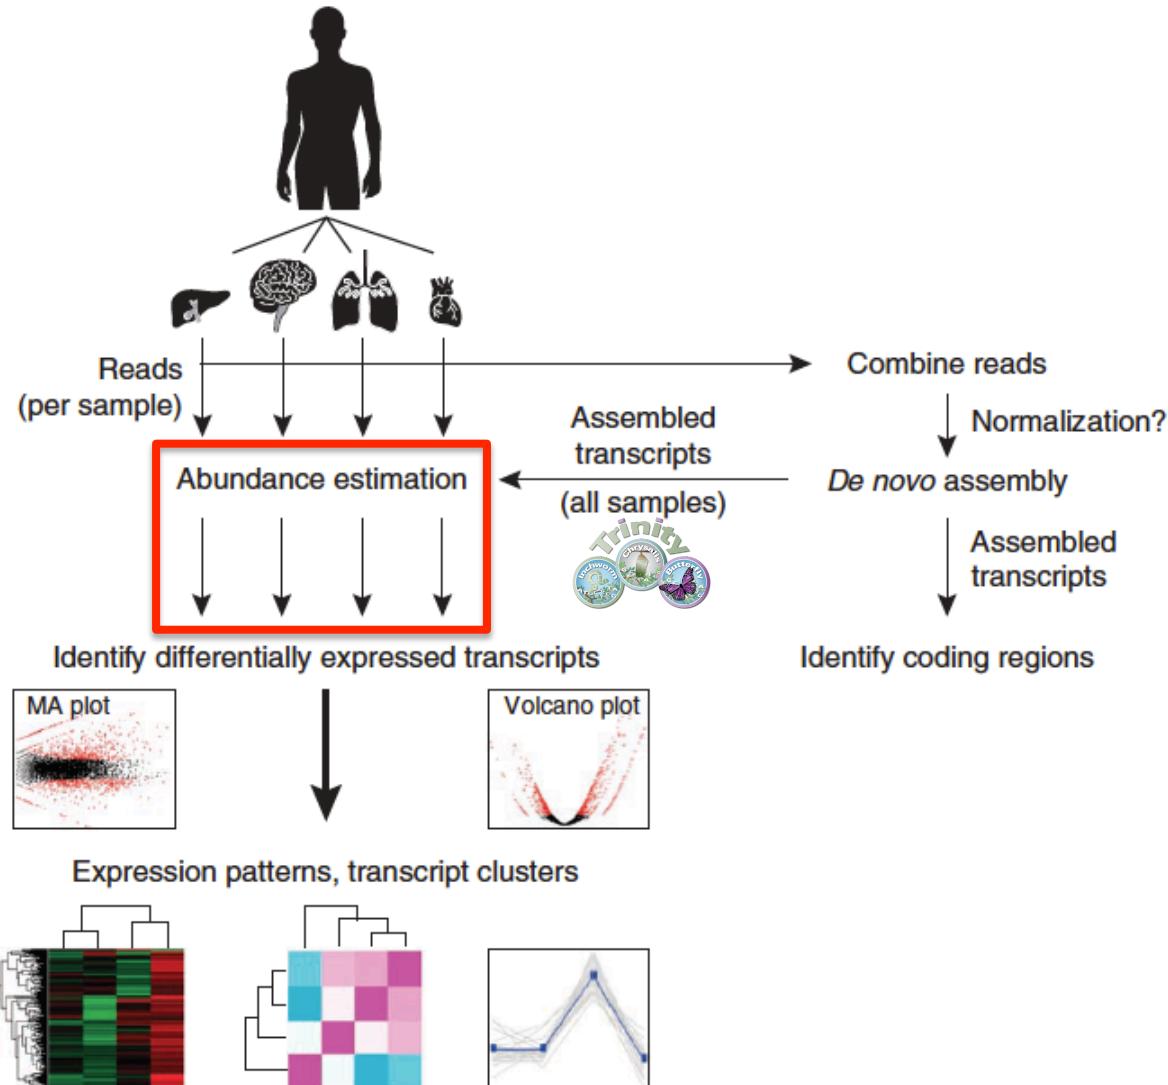

“RSEM-EVAL [sic] uses a novel probabilistic model-based method to compute the joint probability of both an assembly and the RNA-Seq data as an evaluation score.”

Li et al. Evaluation of de novo transcriptome assemblies from RNA-Seq data, Genome Biology 2014

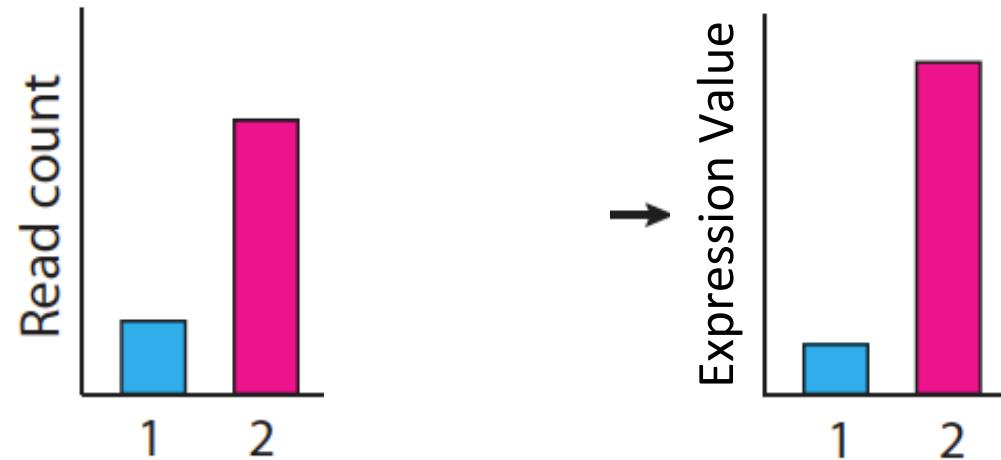

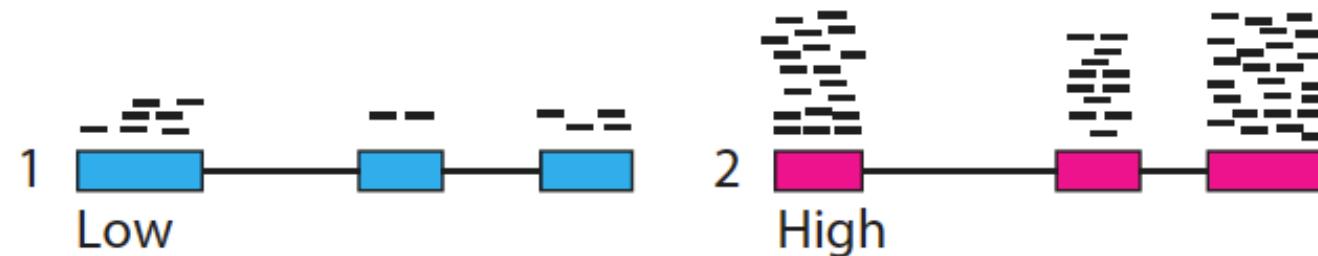

Abundance Estimation

(Aka. Computing Expression Values)

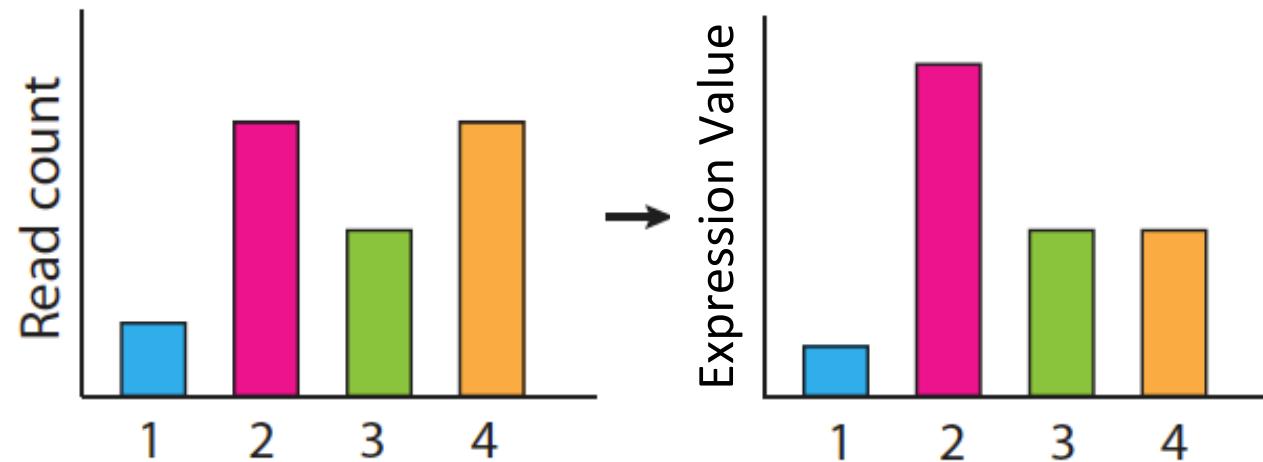

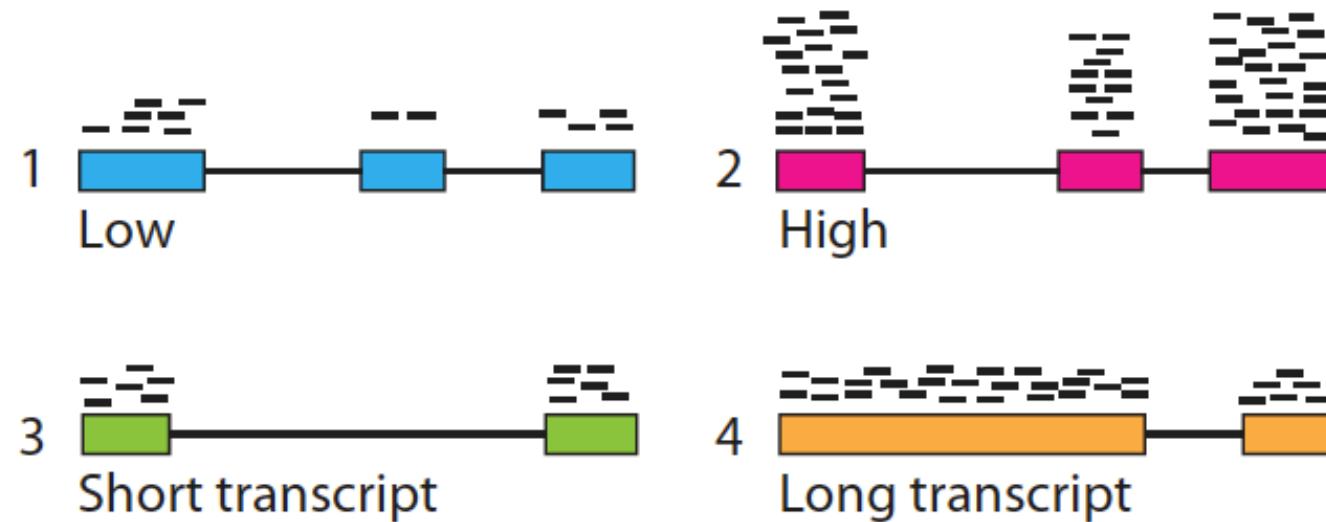

Bioconductor,
& Trinity

Calculating expression of genes and transcripts

Slide courtesy of Cole Trapnell

Calculating expression of genes and transcripts

Slide courtesy of Cole Trapnell

Normalized Expression Values

- Transcript-mapped read counts are normalized for both length of the transcript and total depth of sequencing.
- Reported as: Number of RNA-Seq **F**ragments
Per **K**ilobase of transcript
per total **M**illion fragments mapped
FPKM

RPKM (reads per kb per M) used with Single-end RNA-Seq reads
FPKM used with Paired-end RNA-Seq reads.

Transcripts per Million (TPM)

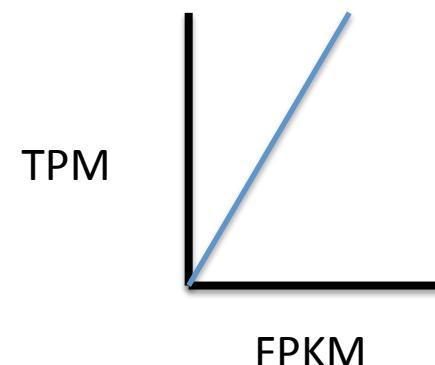

$$TPM_i = \frac{FPKM_i}{\sum_j FPKM} * 1e6$$

Preferred metric for measuring expression

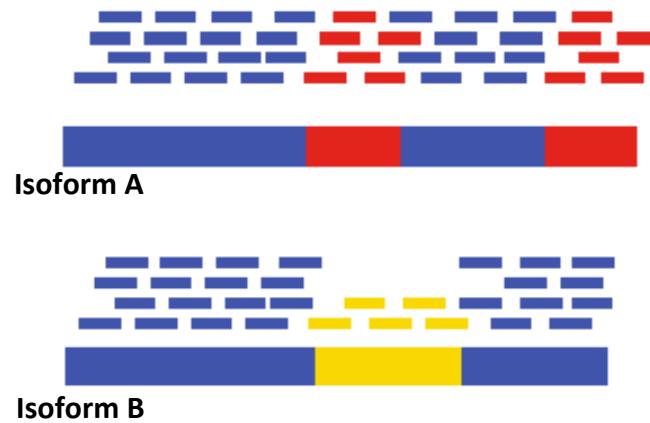

- Better reflects transcript concentration in the sample.
- Nicely sums to 1 million

Linear relationship between TPM and FPKM values.

Both are valid metrics, but best to be consistent.

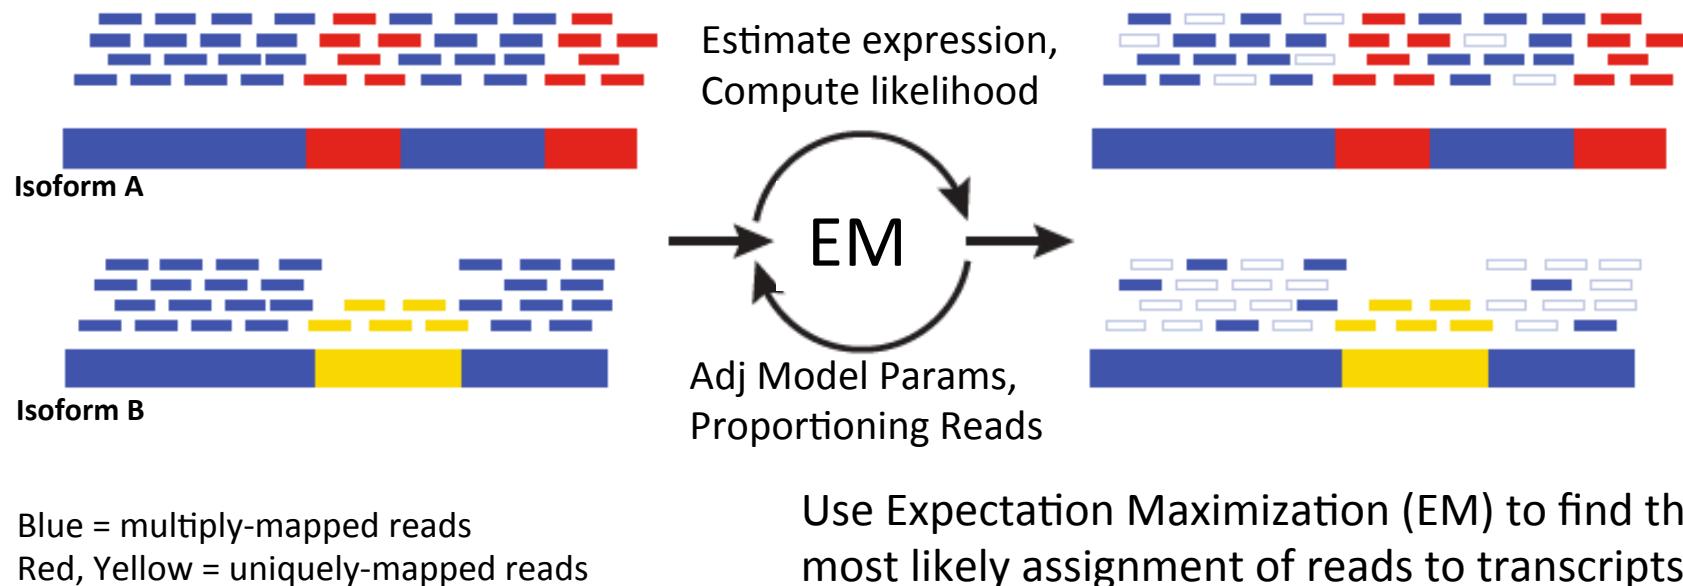

Multiply-mapped Reads Confound Abundance Estimation

Blue = multiply-mapped reads
Red, Yellow = uniquely-mapped reads

Multiply-mapped Reads Confound Abundance Estimation

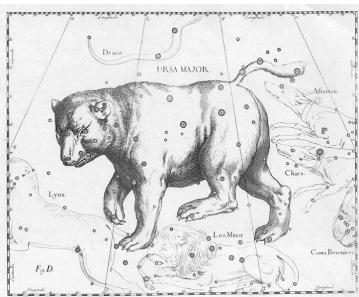

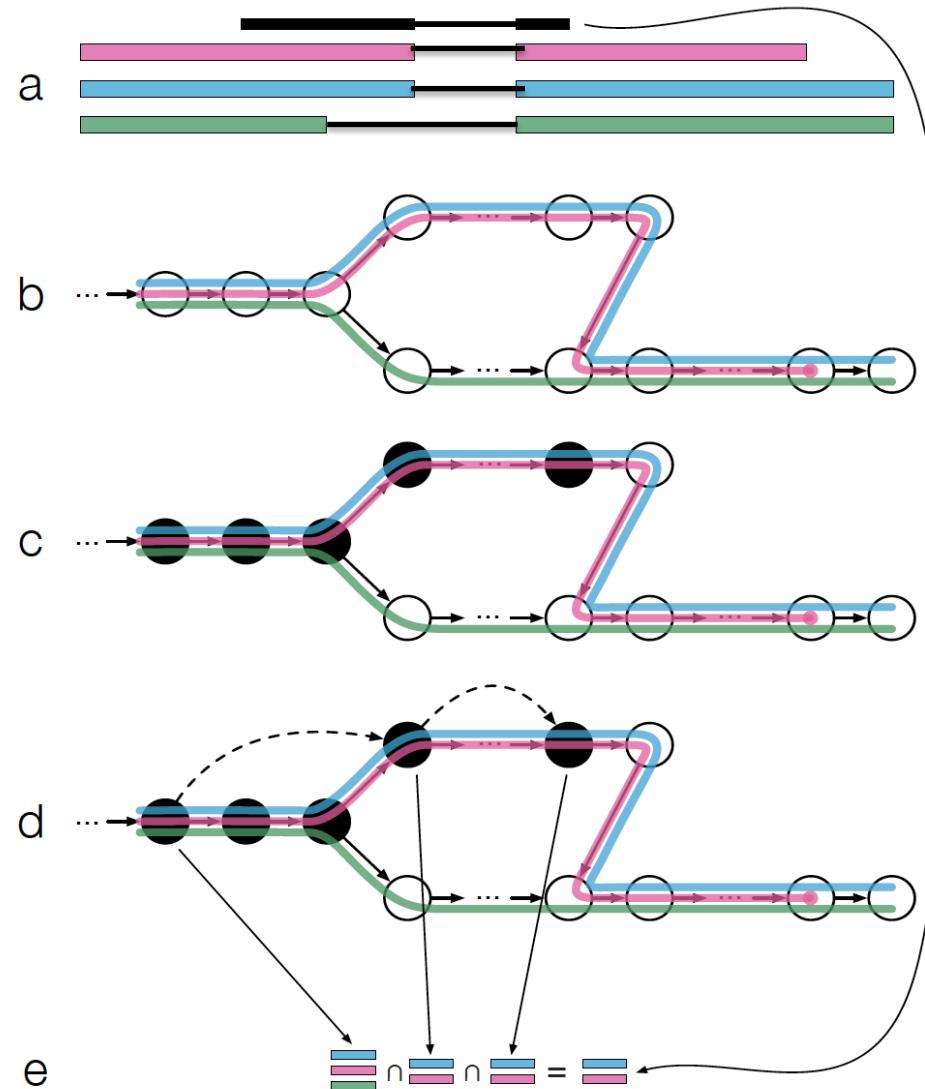

Use Expectation Maximization (EM) to find the most likely assignment of reads to transcripts.

Performed by:

- Cufflinks, String Tie (Tuxedo)
- RSEM, eXpress (genome-free)
- Kallisto, Salmon (alignment-free)

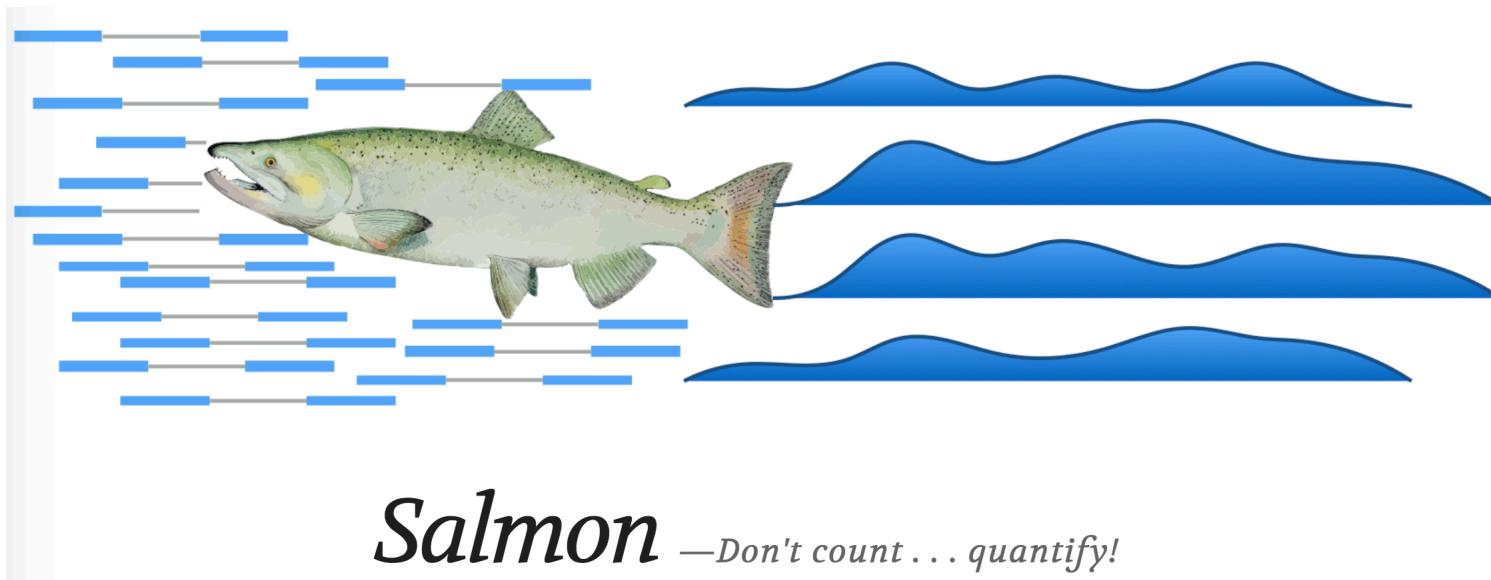

Fast Abundance Estimation Using Pseudo-alignments and Equivalence Classes

Comparing RNA-Seq Samples

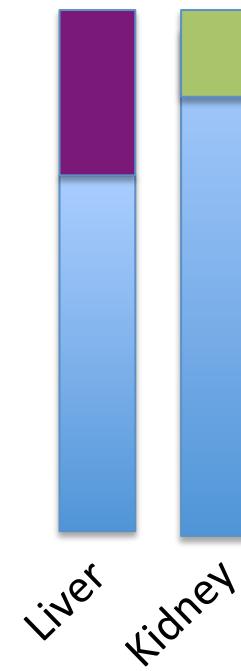

Some Cross-sample Normalization May Be Required

Why cross-sample normalization is important

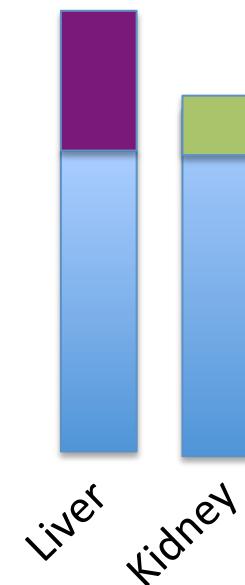

Absolute RNA quantities per cell

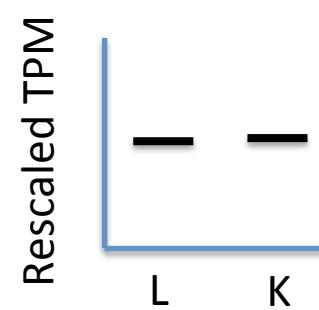

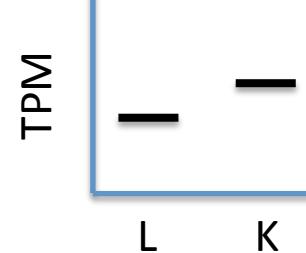

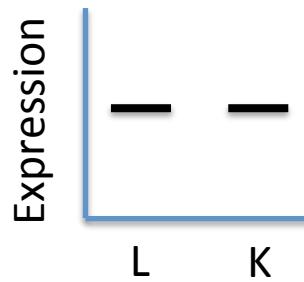

Measured relative abundance via RNA-Seq

Cross-sample normalized (rescaled) relative abundance

e.g. Some housekeeping gene's expression level:

Cross-sample Normalization Required Otherwise, housekeeping genes look diff expressed due to sample composition differences

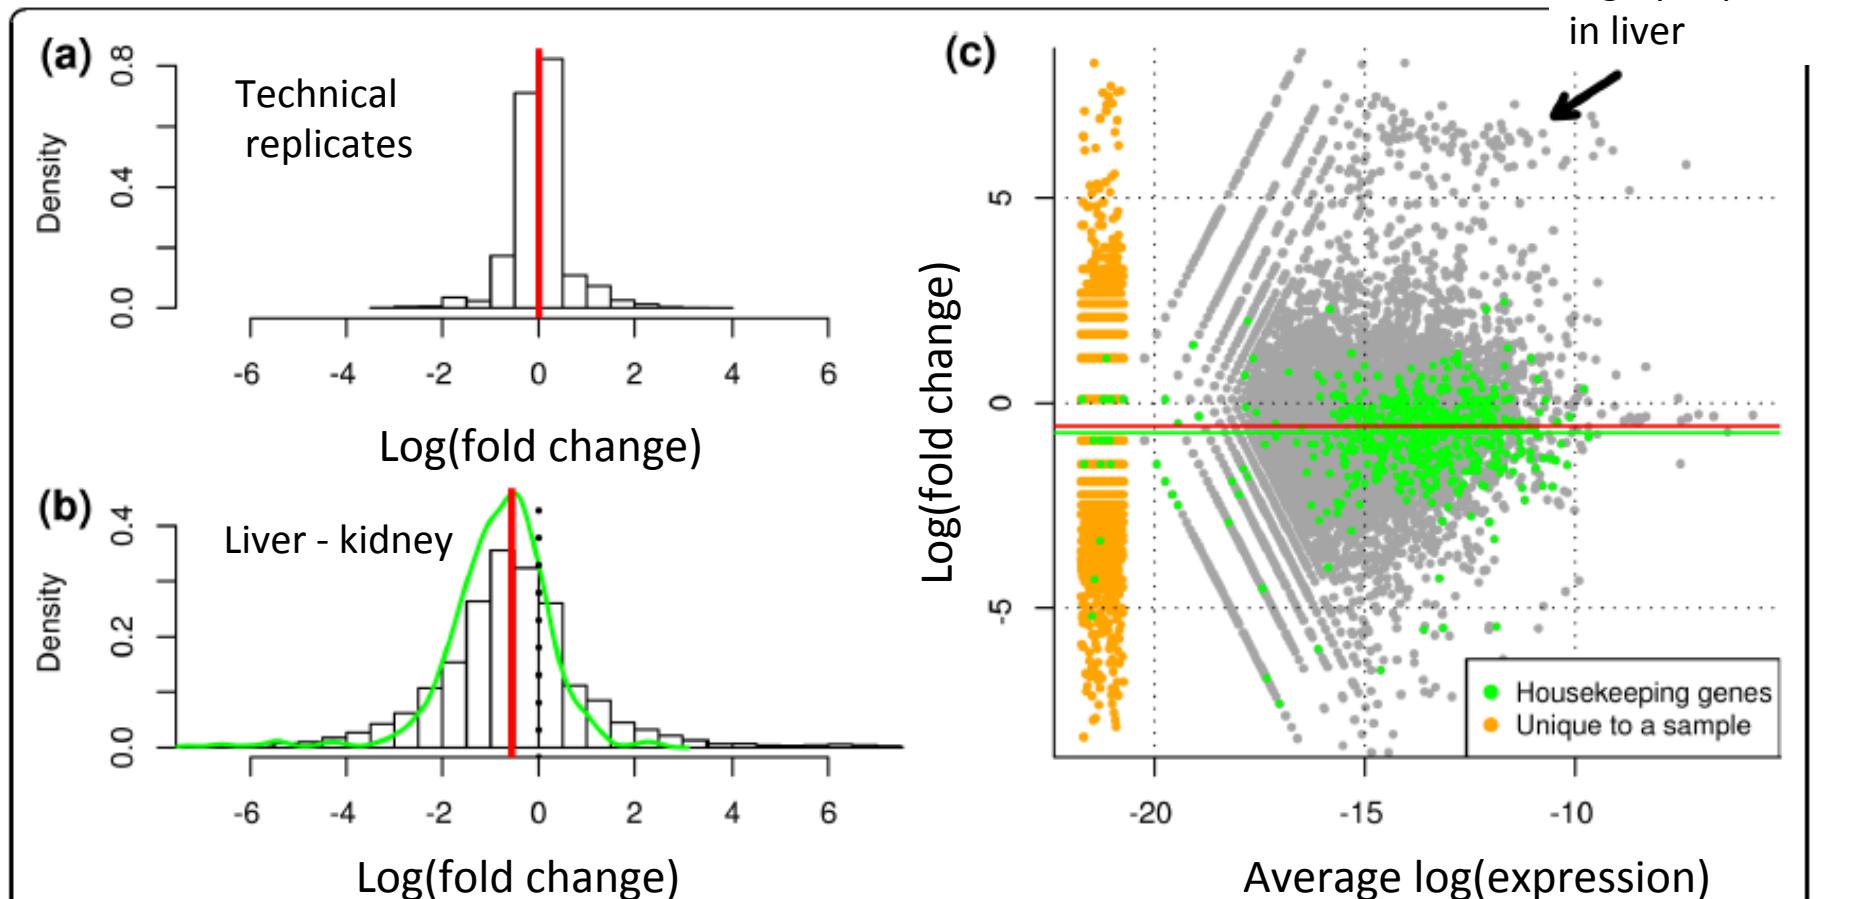

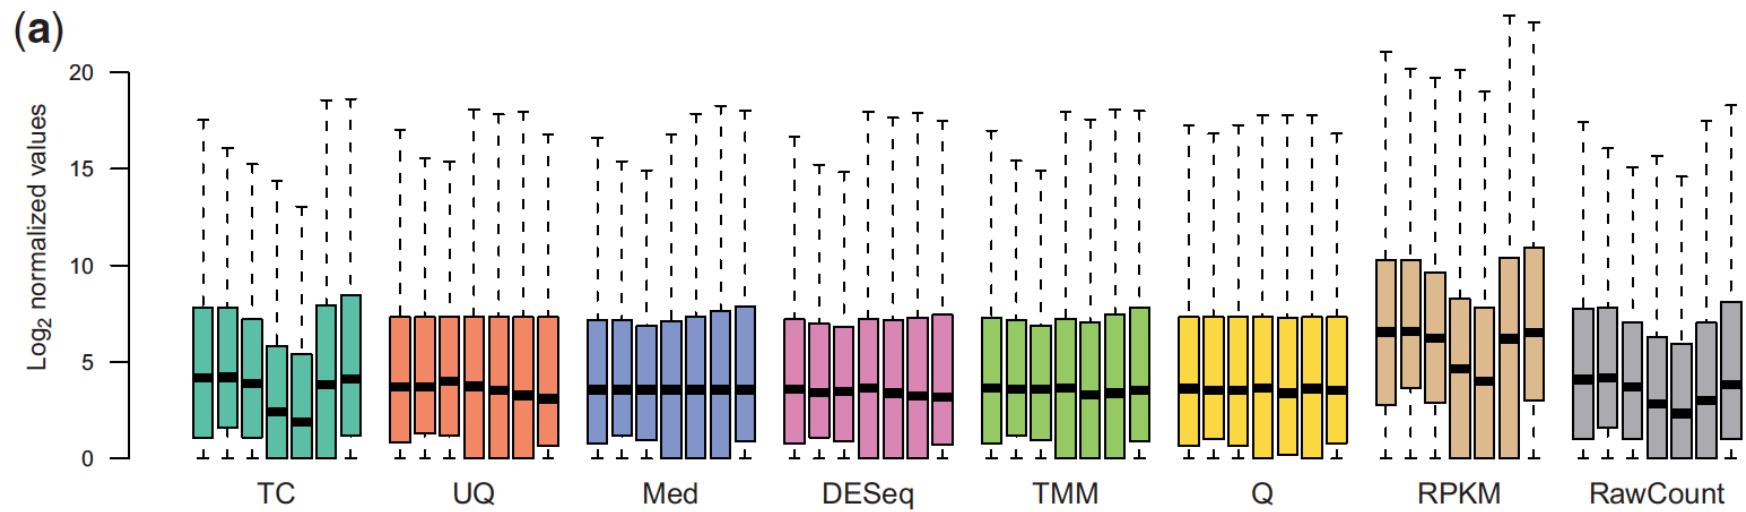

Figure 1 Normalization is required for RNA-seq data. Data from [6] comparing log ratios of **(a)** technical replicates and **(b)** liver versus kidney expression levels, after adjusting for the total number of reads in each sample. The green line shows the smoothed distribution of log-fold-changes of the housekeeping genes. **(c)** An M versus A plot comparing liver and kidney shows a clear offset from zero. Green points indicate 545 housekeeping genes, while the green line signifies the median log-ratio of the housekeeping genes. The red line shows the estimated TMM normalization factor. The smear of orange points highlights the genes that were observed in only one of the liver or kidney samples, illustrating the overall bias in log-fold-changes.

Differential Expression Analysis

Thx, Charlotte Soneson! ☺

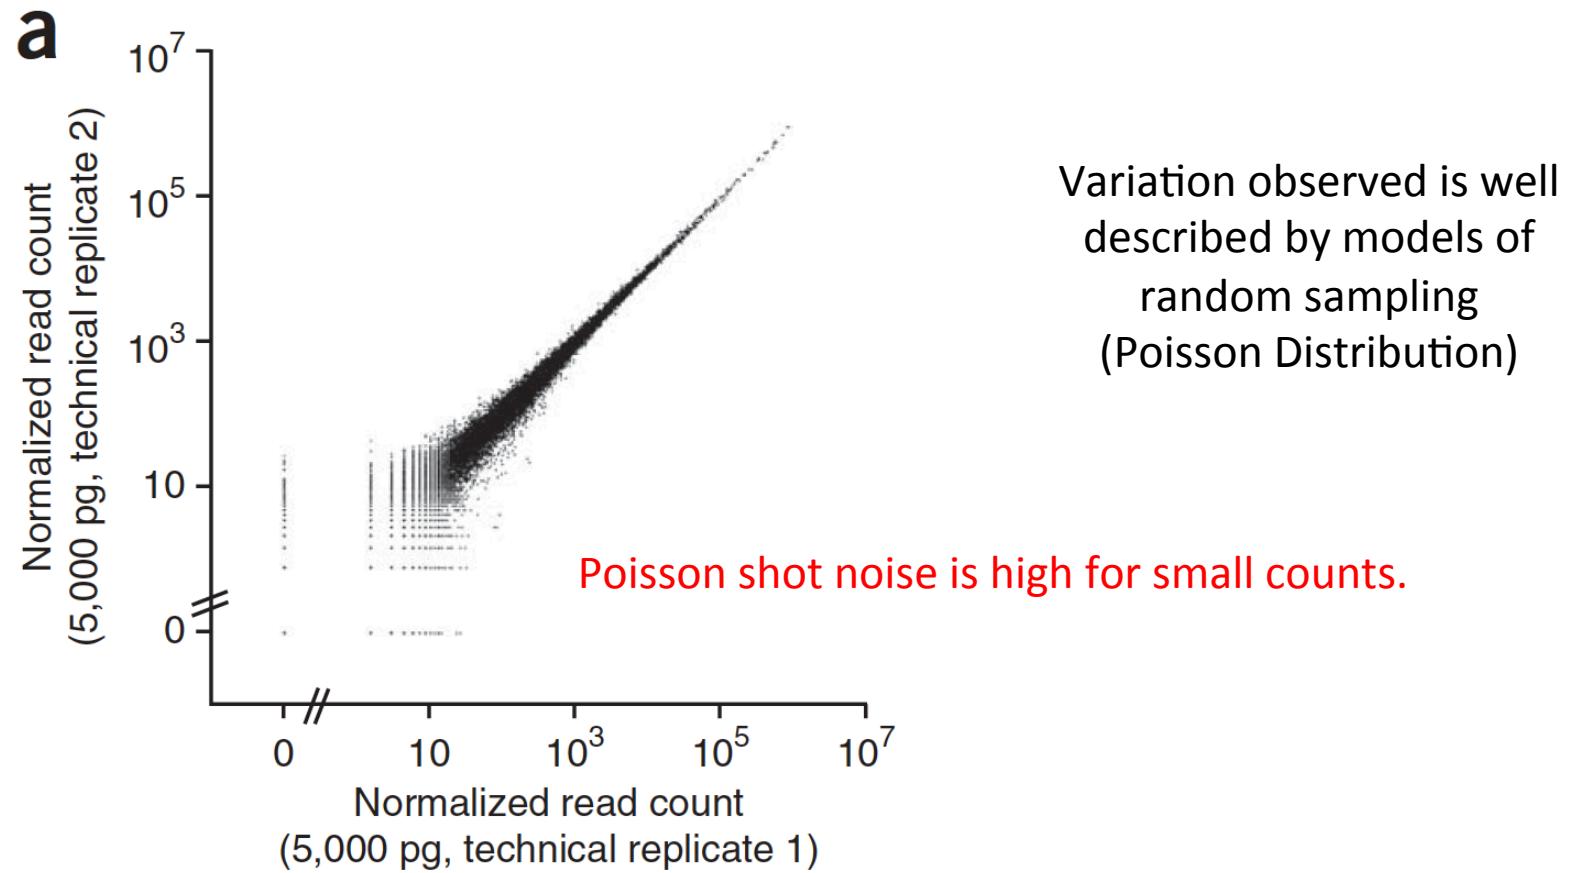

Differential Expression Analysis Involves

- Counting reads mapped to features
- Statistical significance testing

Beware of small counts leading to notable fold changes

	Sample_A	Sample_B	Fold_Change	Significant?
Gene A	1	2	2-fold	No
Gene B	100	200	2-fold	Yes

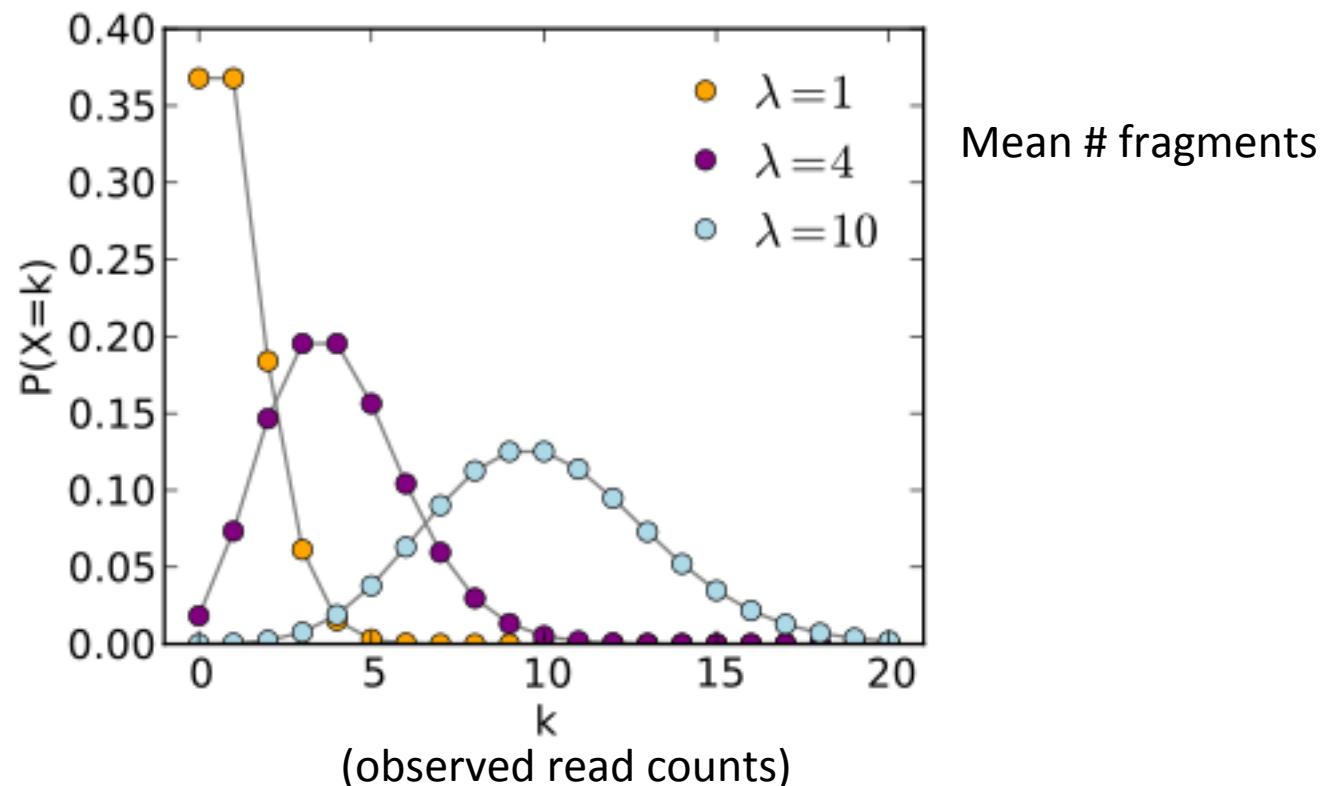

Variation Observed Between Technical Replicates

* plot from Brennecke, et al. Nature Methods, 2013

Observed RNA-Seq Counts Result from Random Sampling of the Population of Reads

Technical variation in RNA-Seq counts per feature is well modeled by the Poisson distribution

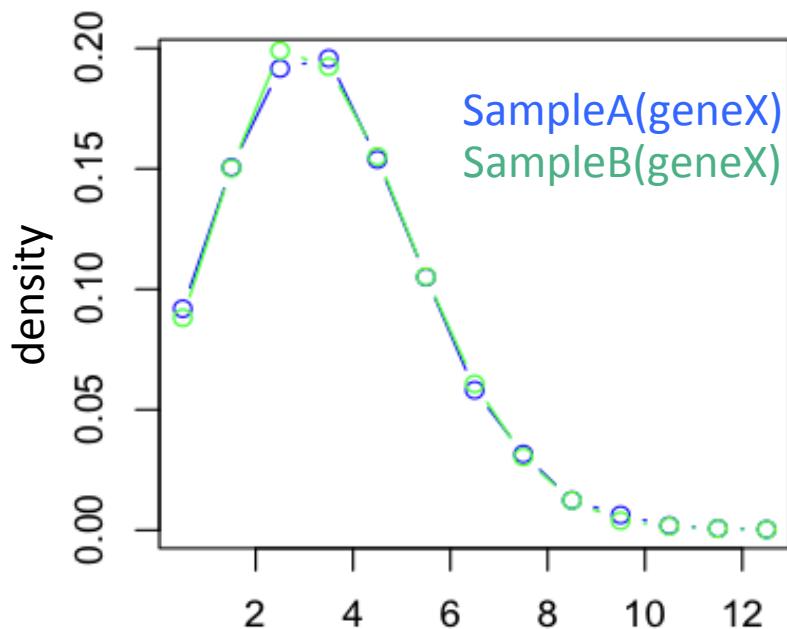

See: http://en.wikipedia.org/wiki/Poisson_distribution

Example: One gene*not* differentially expressed

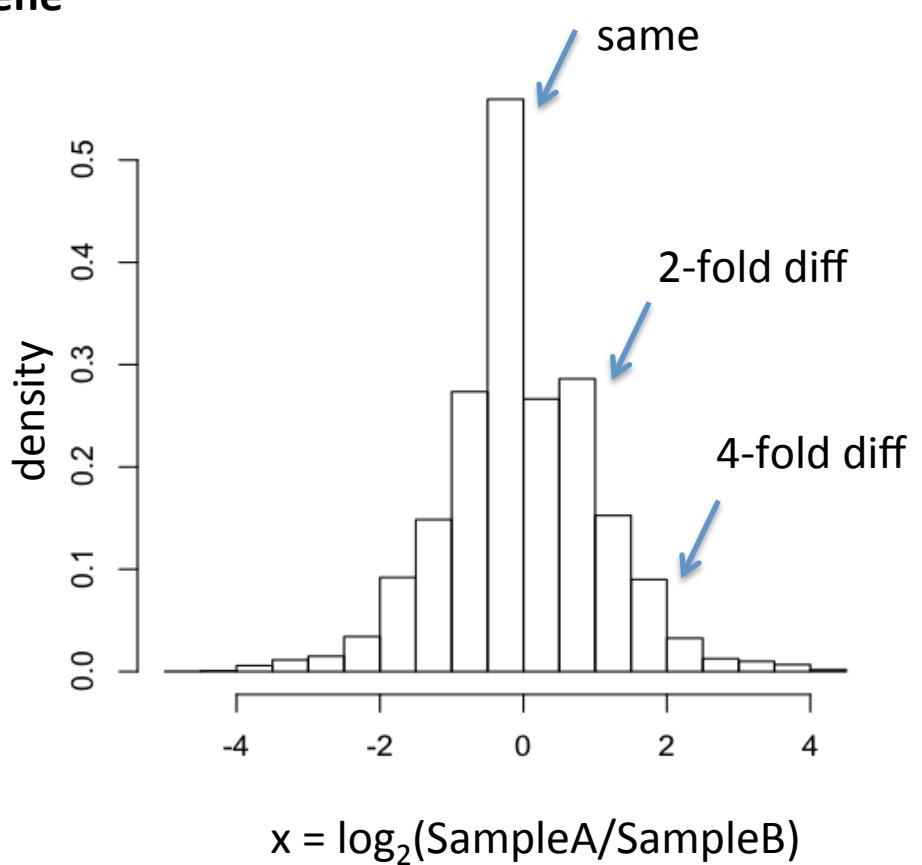

Example: SampleA(gene) = SampleB(gene) = 4 reads

Distribution of observed counts for single gene
(under Poisson model)

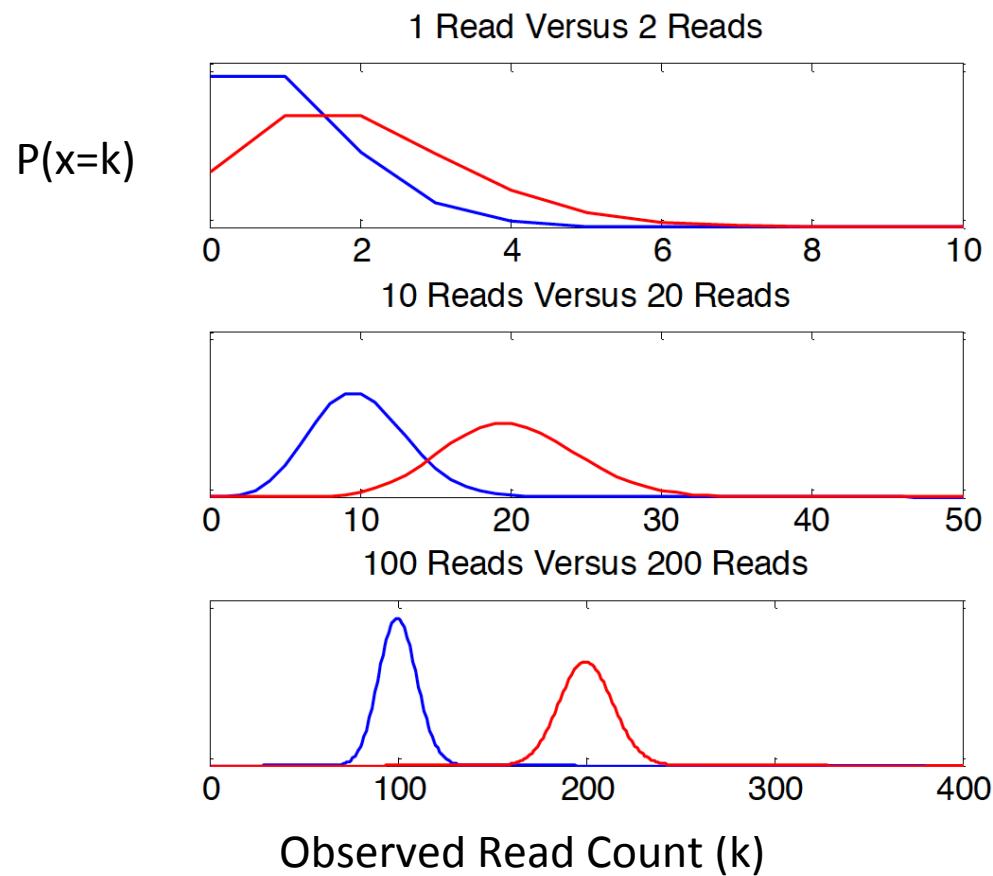

(k) number of reads observed

Dist. of $\log_2(\text{fold change})$ values

Sequencing Depth Matters

Poisson distributions for counts based on **2-fold** expression differences

No confidence in 2-fold difference. Likely observed by chance.

High confidence in 2-fold difference. Unlikely observed by chance.

From: <http://gkno2.tumblr.com/post/24629975632/thinking-about-rna-seq-experimental-design-for>
and from supplementary text of Busby et al., Bioinformatics, 2013

Greater Depth = More Statistical Power

Example: Single gene, reads sampled at different sequencing depths

Reads per sample	Sample A Number of reads	Sample B Number of reads	P-value (Fishers Exact Test)
100,000	1	2	1
1,000,000	10	20	0.099
10,000,000	100	200	8.0e-09

Technical vs. Biological Replicates

RNA-Seq Technical replicates aren't essential

(Technical variation is well-modeled by the Poisson distribution)

“We find that the Illumina sequencing data are highly replicable, with relatively little technical variation, and thus, for many purposes, it may suffice **to sequence each mRNA sample only once**” *Marioni et al., Genome Research, 2008*

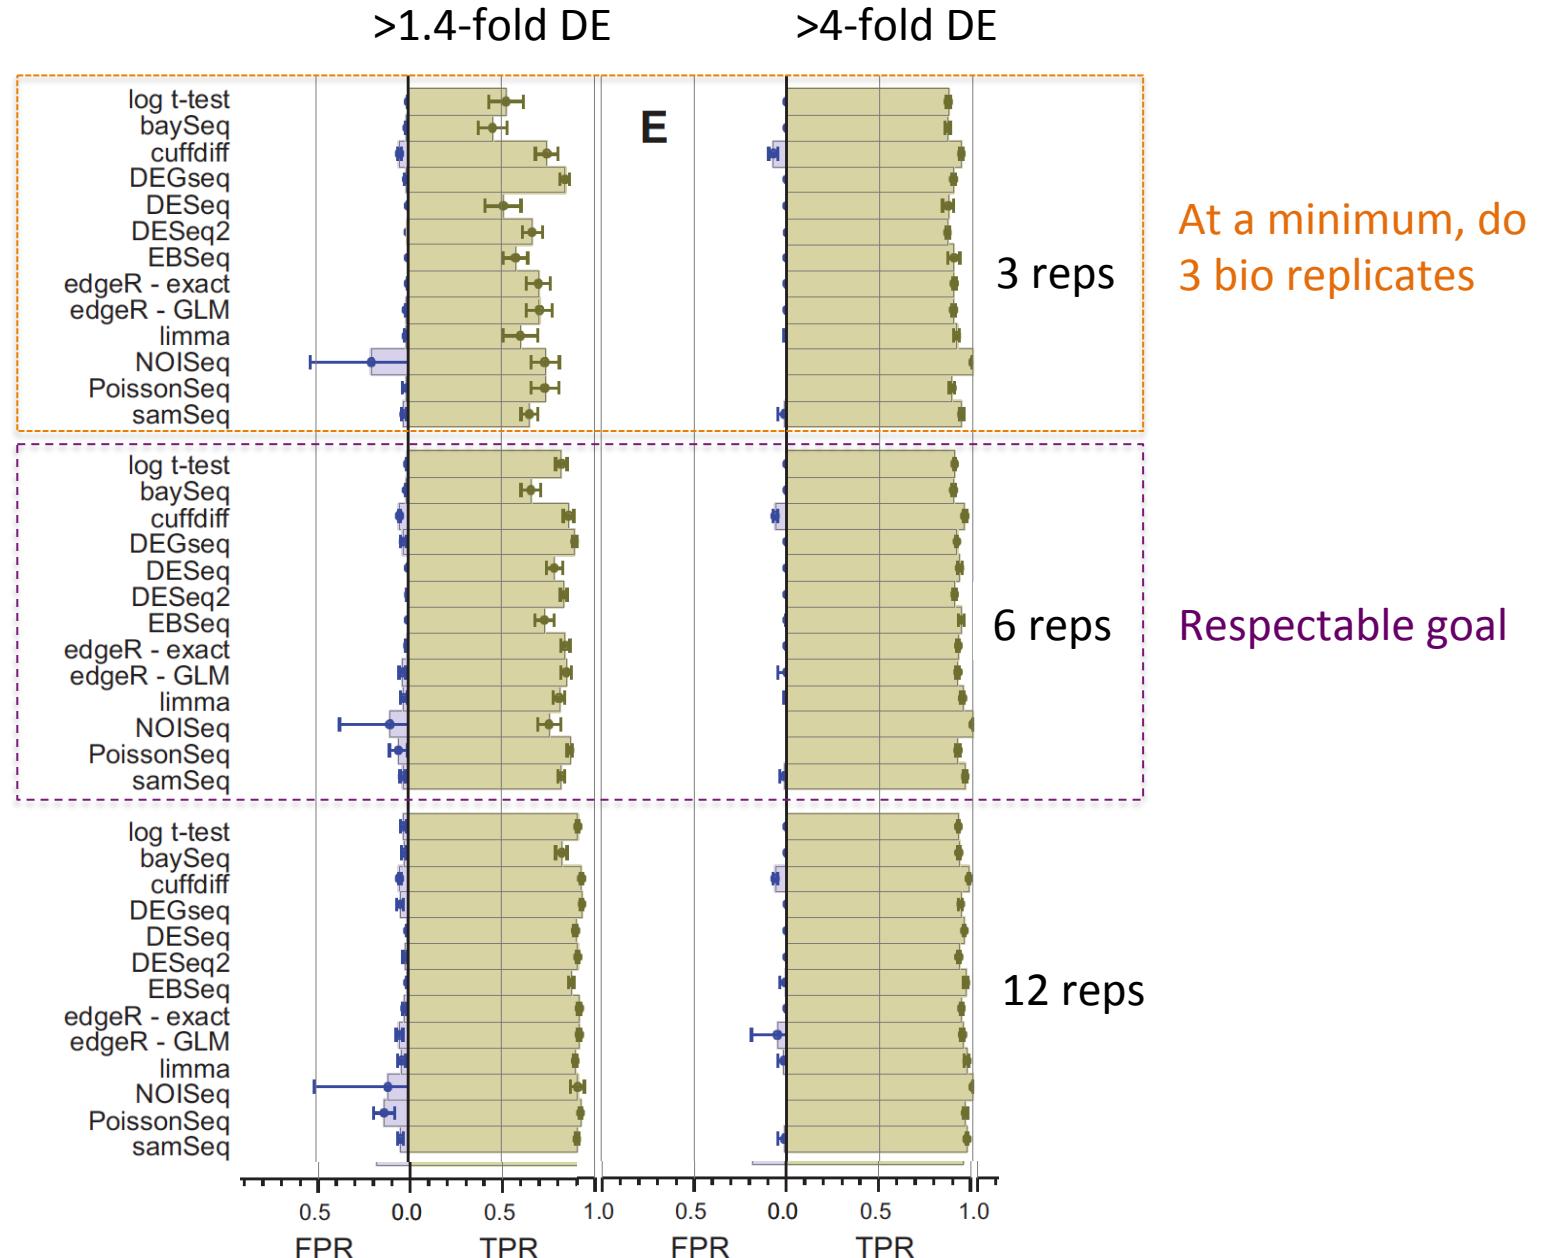

However, biological replicates *ARE* essential

$$\text{total_variance} = \text{technical_variance} + \text{biological_variance}$$

(Total variance well-modeled by negative binomial distribution)

“**... at least six biological replicates should be used**, rising to at least 12 when it is important to identify SDE genes for all fold changes.” *Schurch et al., RNA, 2016*

DE Accuracy Improves with Higher Biological Replication

DOI 10.1186/s13059-017-1372-2

METHOD **Open Access** 

DE-kupl: exhaustive capture of biological variation in RNA-seq data through *k*-mer decomposition

Jérôme Audoux¹, Nicolas Philippe^{2,3}, Rayan Chikhi⁴, Mikaël Salson⁴, Mélina Gallopin⁵, Marc Gabrie^{5,6}, Jérémie Le Coz⁵, Emilie Drouineau⁵, Thérèse Commes^{1,2} and Daniel Gautheret^{5,6*} 

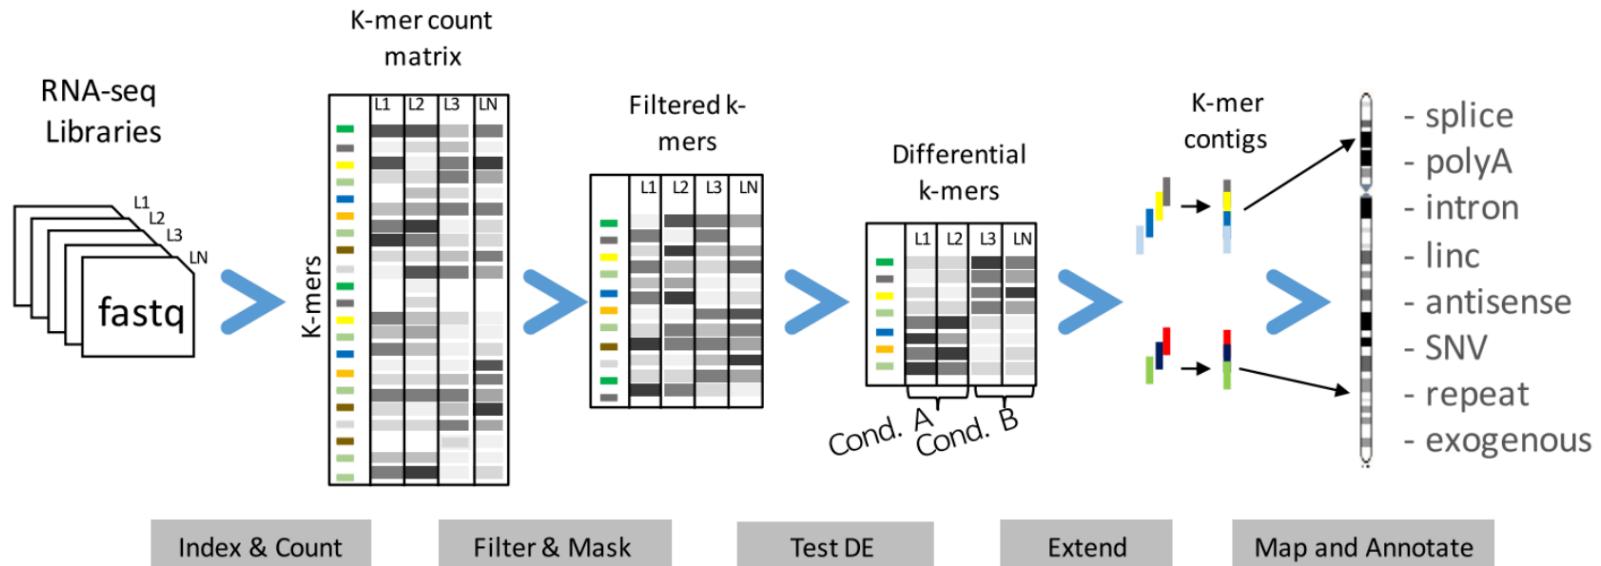

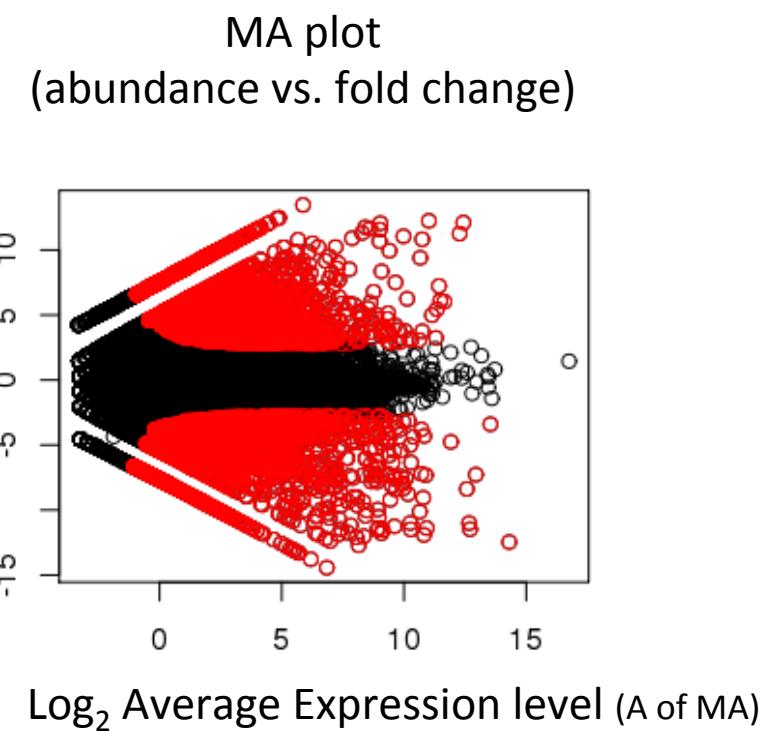

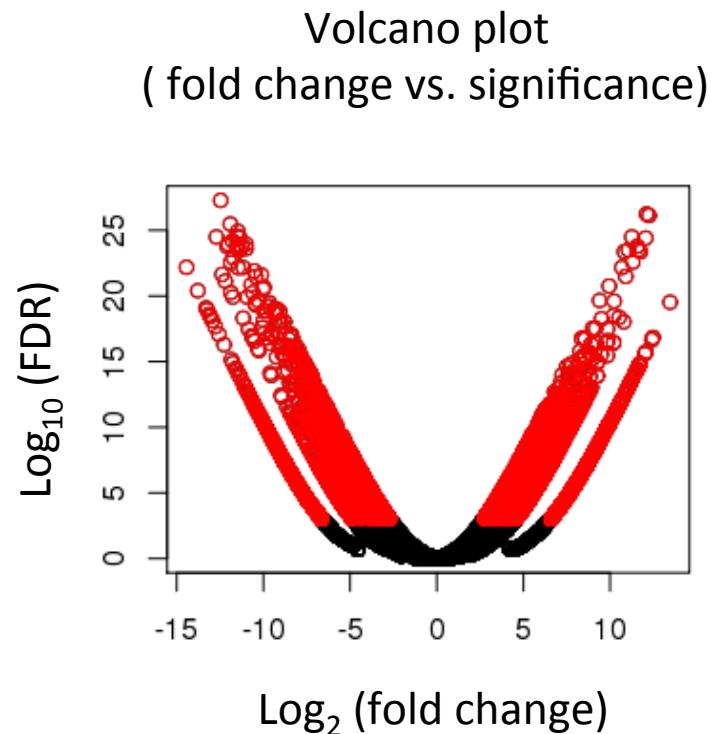

Fig. 4 The DE-kupl pipeline for the discovery and analysis of differentially expressed *k*-mers. First, Jellyfish is applied to count *k*-mers in all libraries. *k*-mers counts are then joined into a count matrix and filtered for low recurrence and matching to the reference transcriptome. Normalization factors are computed from raw *k*-mer counts and the differential expression procedure is applied. Finally, overlapping differentially expressed *k*-mers are extended into contigs and annotated based on their alignment to the reference and overlap with annotated genes.

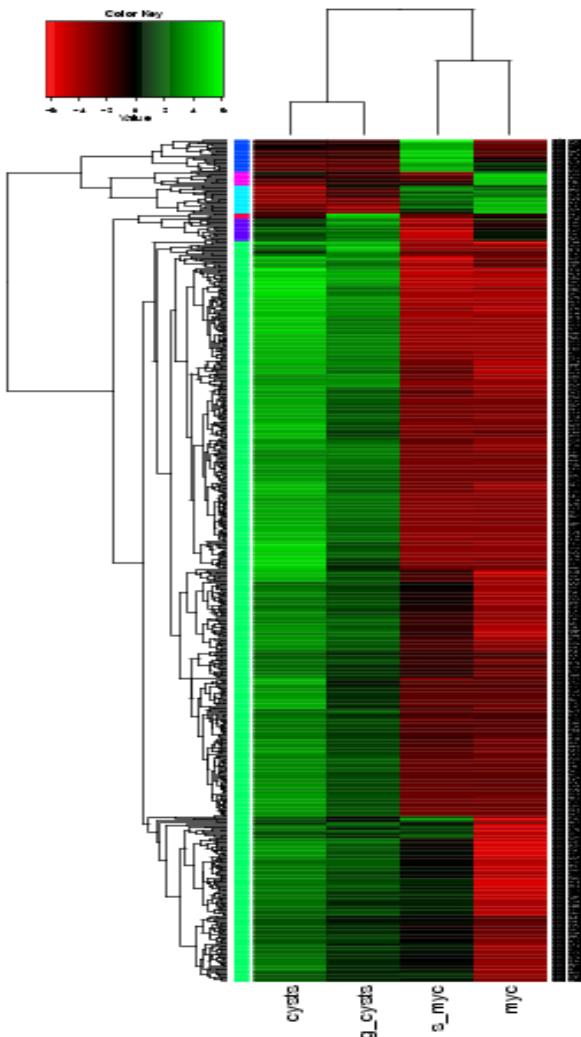

Visualization of DE results and Expression Profiling

Plotting Pairwise Differential Expression Data

Significantly differently expressed transcripts have FDR <= 0.001
(shown in red)

Comparing Multiple Samples

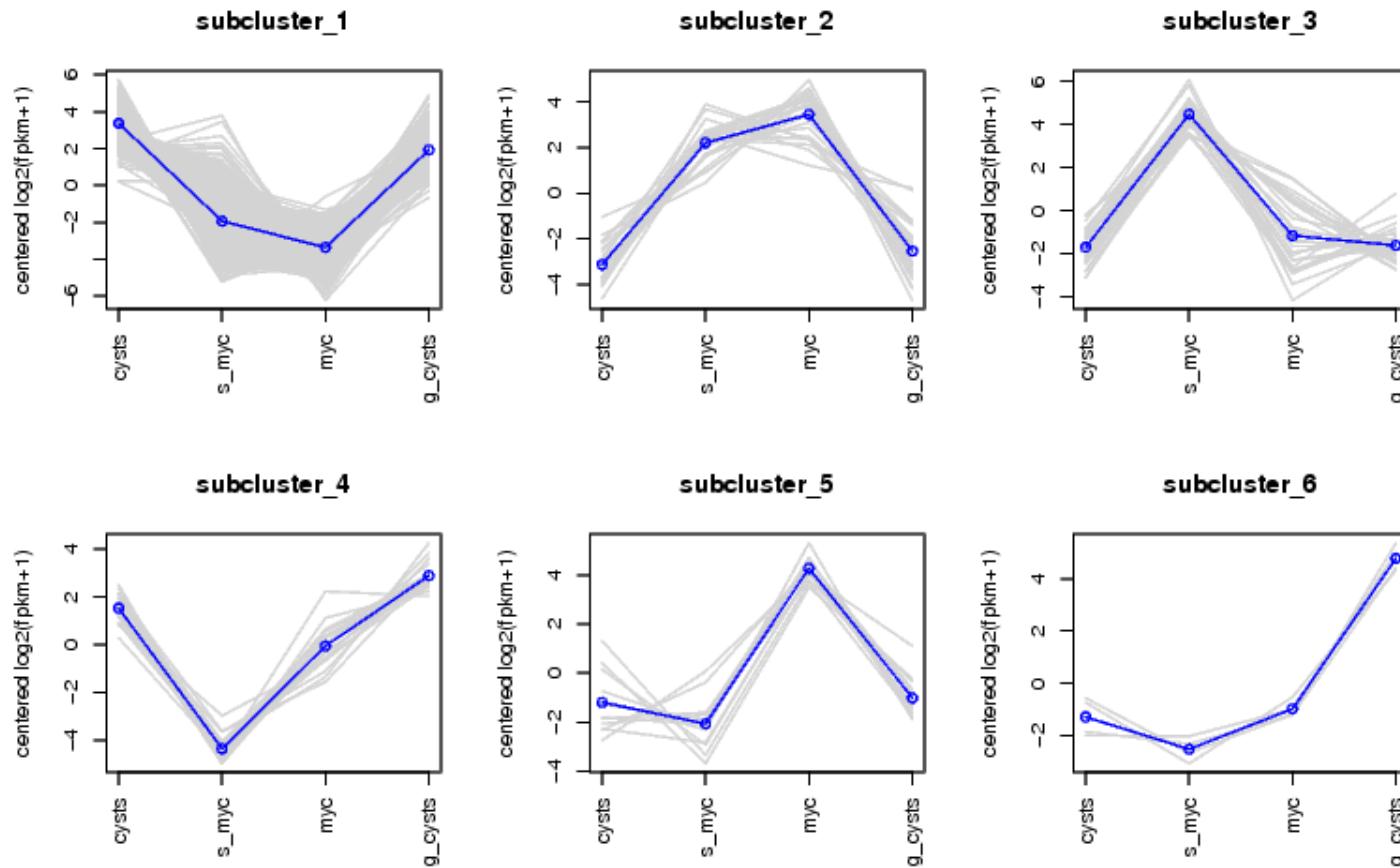

Heatmaps provide an effective tool for navigating differential expression across multiple samples.

Clustering can be performed across both axes:
-cluster transcripts with similar expression patterns.
-cluster samples according to similar expression values among transcripts.

Examining Patterns of Expression Across Samples

Can extract clusters of transcripts and examine them separately.

Protein spotlight

Something Else
March 2017

Knives were crafted to cut. Yet how many of us use them to slit an envelope. Or prise open a lid. Nature too has its ways of perverting a design so that its initial role is altered to become another. This is exactly what happened to a protein known as osteocrin. Osteocrin was first discovered in bone.

Protein | Fructosamine-3-kinase

Gene | FN3K

Organism | Homo sapiens (Human)

Status | ★ Reviewed - Annotation score: ●●●●○ - Experimental evidence at protein levelⁱ

Functionⁱ

May initiate a process leading to the deglycation of fructoselysine and of glycated proteins. May play a role in the phosphorylation of 1-deoxy-1-morpholinofructose (DMF), fructoselysine, fructoseglycine, fructose and glycated lysozyme.

Find all ORFs using ORFfinder

Secure <https://www.ncbi.nlm.nih.gov/orffinder/>

NCBI Resources How To Sign in to NCBI

ORFfinder PubMed Search

Open Reading Frame Finder

ORF finder searches for open reading frames (ORFs) in the DNA sequence you enter. The program returns the range of each ORF, along with its protein translation. Use ORF finder to search newly sequenced DNA for potential protein encoding segments, verify predicted protein using newly developed SMART BLAST or regular BLASTP.

This web version of the ORF finder is limited to the subrange of the query sequence up to 50 kb long. Stand-alone version, which doesn't have query sequence length limitation, is available for [Linux x64](#).

Examples (click to set values, then click Submit button) :

- NC_011604 *Salmonella enterica* plasmid pWES-1; genetic code: 11; 'ATG' and alternative initiation codons; minimal ORF length: 300 nt
- NM_000059; genetic code: 1; start codon: 'ATG only'; minimal ORF length: 150 nt

Enter Query Sequence

Enter accession number, gi, or nucleotide sequence in FASTA format:

```
GGAGCTGGAGGCCCAAGGCAACTACACCGTCCACGTACCCAGAGGGGCTGGGCCCTCCC

```

From: To:

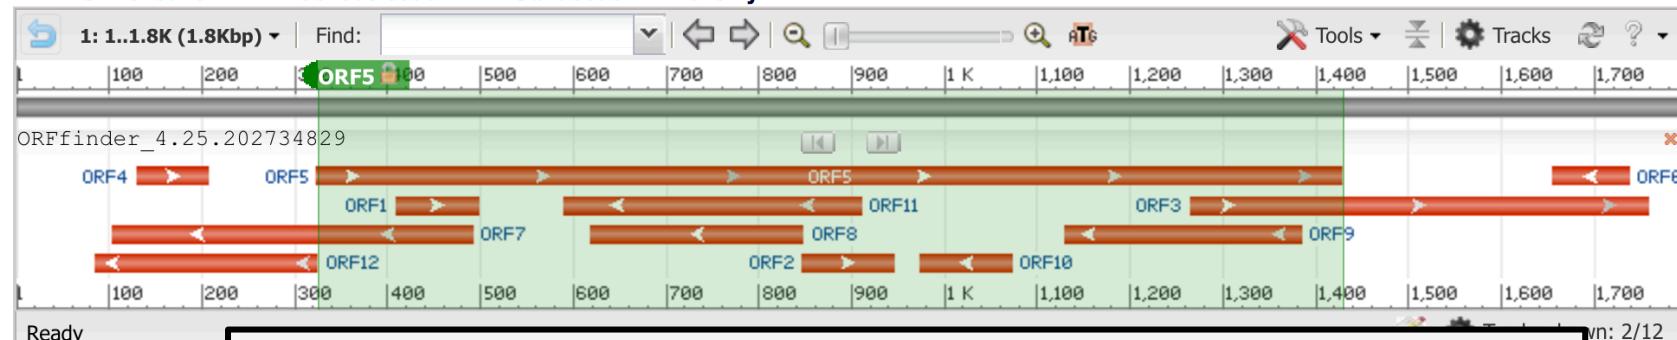

ORFfinder finds all open reading frames and provides translations

The screenshot shows the NCBI ORFfinder interface. At the top, there's a browser header with 'Secure' and the URL 'https://www.ncbi.nlm.nih.gov/orffinder/'. Below it is a blue navigation bar with 'NCBI Resources' and 'How To'. The main title 'ORFfinder' is on the left, and a search bar with 'PubMed' dropdown and 'Search' button is on the right. A 'Sign in to NCBI' link is in the top right corner.

Open Reading Frame Viewer

Sequence ORFs can appear in random sequence – so further analysis is required

CBS >> CBS Prediction Servers >> SignalP

SignalP 4.1 Server

SignalP 4.1 server predicts the presence and location of signal peptide cleavage sites in amino acid sequences from different organisms: Gram-positive prokaryotes, Gram-negative prokaryotes, and eukaryotes. The method incorporates a prediction of cleavage sites and a signal peptide/non-signal peptide prediction based on a combination of several artificial neural networks.

View the [version history](#) of this server. All the previous versions are available online, for comparison and reference.

NEW: The portable version of SignalP 4.1, previously only available for Mac (Darwin), Linux, and IRIX, is now also available for Windows systems. Academic users: select the "CYGWIN" option at the [download page](#). [Cygwin](#) or [MobaXterm](#) is required to install SignalP under Windows. For details, read the [installation instructions](#).

SUBMISSION

Paste a single amino acid sequence or several sequences in **FASTA** format into the field below:

```
MHPAVFLSLPDLRCSLLLLVTWVFTPVTTEITSLDTENIDEILNNADVALVNFYADWCRCFSQMLHPIFEASDVKEEFPNENQVVFARVDCDQHSIAQRYRISKYPTLKLFRNGMMKKERYRGQRSVKALADYIRQQKSDFPQEIRDLAETTLDRSKRNIIGYFEQKDSDNRYRVFERVANILHDDCAFLSAFGDVSKEPERSGDNIIYKPPGHSAAPDMVYLGMATNFDTVNYWIQDKCVPVLREITFENGEEELTEEGLPFLILFHMKEDTESLEIFCNEVARQLISEKGTTINFLHADCDKFRHPLLHIQKTPADCPVIAIDSFRHMYVFGDFKDVLPGKLQFVFDLHSGKLHREFHHGPDPTDTAPGEQAQDVAASSPPESSFQKLAPSEYRYTLLRDEL
```

Submit a file in **FASTA** format directly from your local disk:
 Choose File No file chosen

Organism group (explain)
 Eukaryotes
 Gram-negative bacteria
 Gram-positive bacteria

D-cutoff values (explain)
 Default (optimized for correlation)
 Sensitive (reproduce SignalP 3.0's sensitivity)
 User defined:
0.4 D-cutoff for SignalP-noTM networks
0.5 D-cutoff for SignalP-TM networks

Graphics output (explain)
 No graphics
 PNG (inline)
 PNG (inline) and EPS (as links)

Output format (explain)
 Standard
 Short (no graphics)
 Long
 All - SignalP-noTM and SignalP-TM output (no graphics)

Method (explain)
 Input sequences may include TM regions
 Input sequences do not include TM regions

Positional limits (explain)
 Minimal predicted signal peptide length. Default: 10
 N-terminal truncation of input sequence (0 means no truncation). Default: Truncate sequence to a length of 70 aa

Example SignalP predicted signal peptide

Gene ontology analysis for RNA-seq: accounting for selection bias

Matthew D Young, Matthew J Wakefield, Gordon K Smyth and Alicia Oshlack 

Genome Biology 2010 11:R14 | DOI: 10.1186/gb-2010-11-2-r14 | © Young et al.; licensee BioMed Central Ltd. 2010

Gene ontology functional enrichment

	(+) Differentially Expressed	(-) Not Differentially Expressed	Totals
+ Gene Ontology	50	200	250
- Gene Ontology	1950	17800	19750
Totals	2000	18000	20000

	drawn	not drawn	total
green marbles	k	$K - k$	K
red marbles	$n - k$	$N + k - n - K$	$N - K$
total	n	$N - n$	N

The probability of drawing exactly k green marbles can be calculated by the formula

$$P(X = k) = f(k; N, K, n) = \frac{\binom{K}{k} \binom{N-K}{n-k}}{\binom{N}{n}}.$$

Deciphering the Cell Circuitry of Limb Regeneration Via Single Cell Transcriptome Studies

Work done in collaboration with
Jessica Whited's lab

Brigham Regenerative Medicine Center

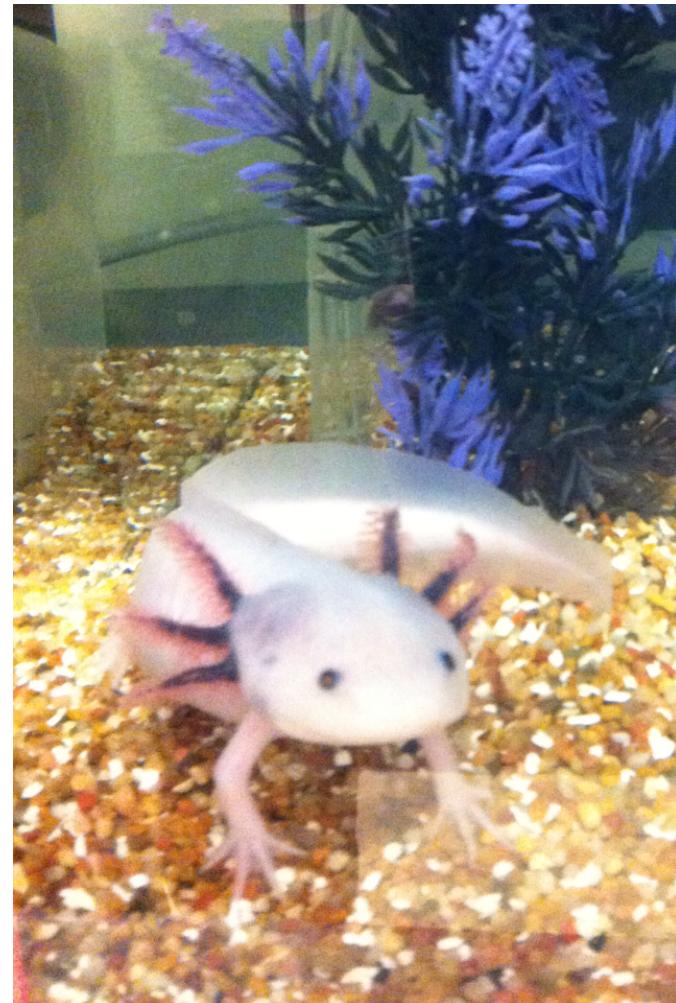

Axolotl (*Ambystoma mexicanum*) Transcriptomics

Axolotl "water monster", aka Mexican salamander or Mexican walking fish.

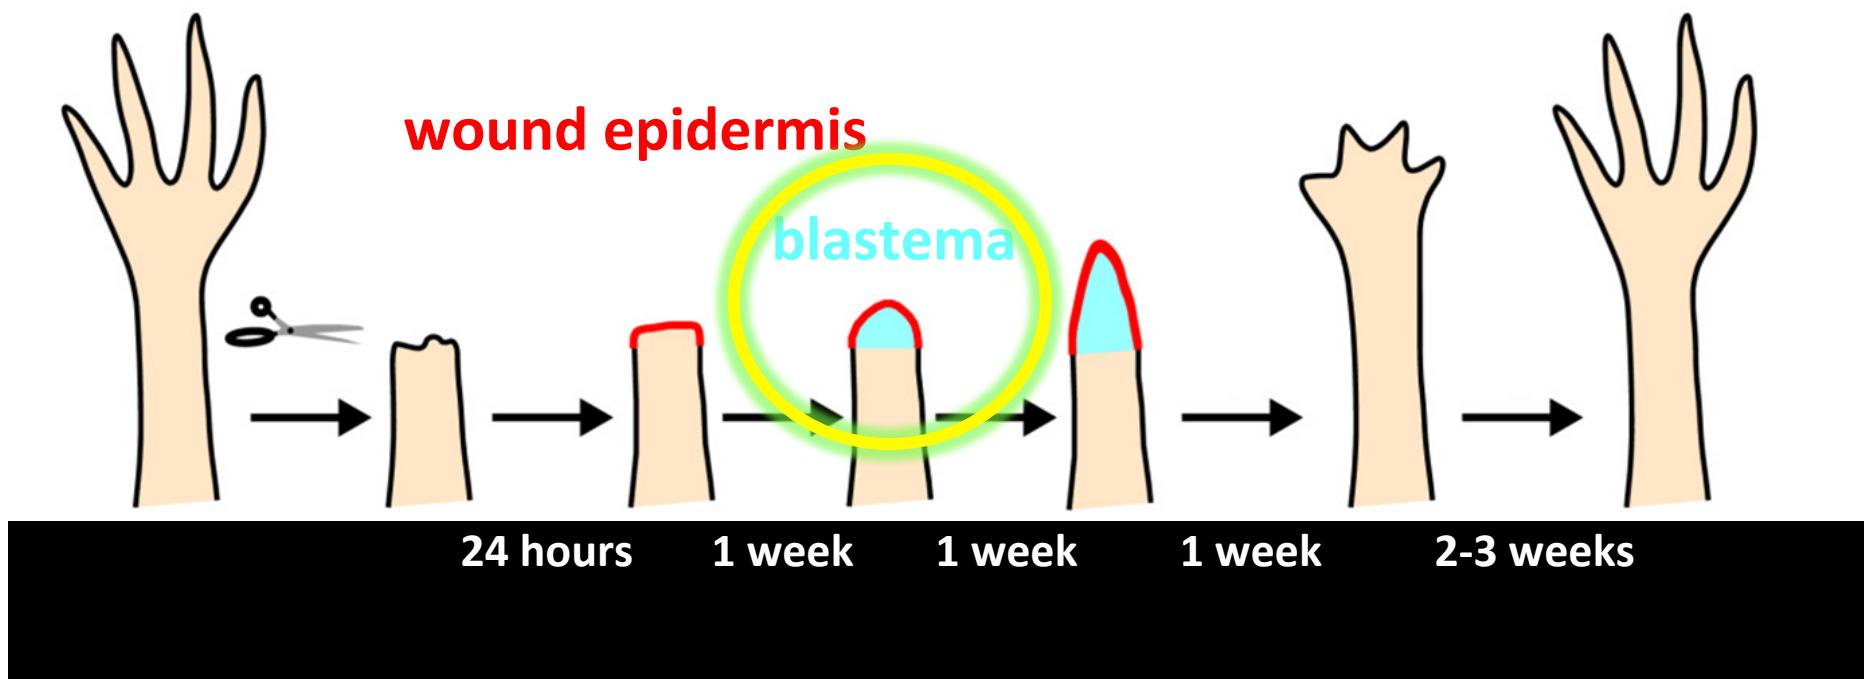

- Model for vertebrate studies of tissue regeneration
- Short generation time
- Can fully regenerate a severed limb in just weeks.
- Genome estimated at ~30 Gb (not yet sequenced)

Original Article

Loggerhead sea turtle embryos (*Caretta caretta*) regulate expression of stress response and developmental genes when exposed to a biologically realistic heat stress

Blair P. Bentley , Brian J. Haas, Jamie N. Tedeschi, Oliver Berry

Summary of Key Points

- RNA-Seq is a versatile method for transcriptome analysis enabling quantification and novel transcript discovery.
- Expression quantification is based on sampling and counting reads derived from transcripts
- Fold changes based on few read counts lack statistical significance.
- Trinity assembly and supported downstream computational analysis tools facilitate transcriptome studies.
- The Trinity framework can empower transcriptome studies for organisms lacking reference genome sequences (ex. Axolotl)

Transcriptomics Lab

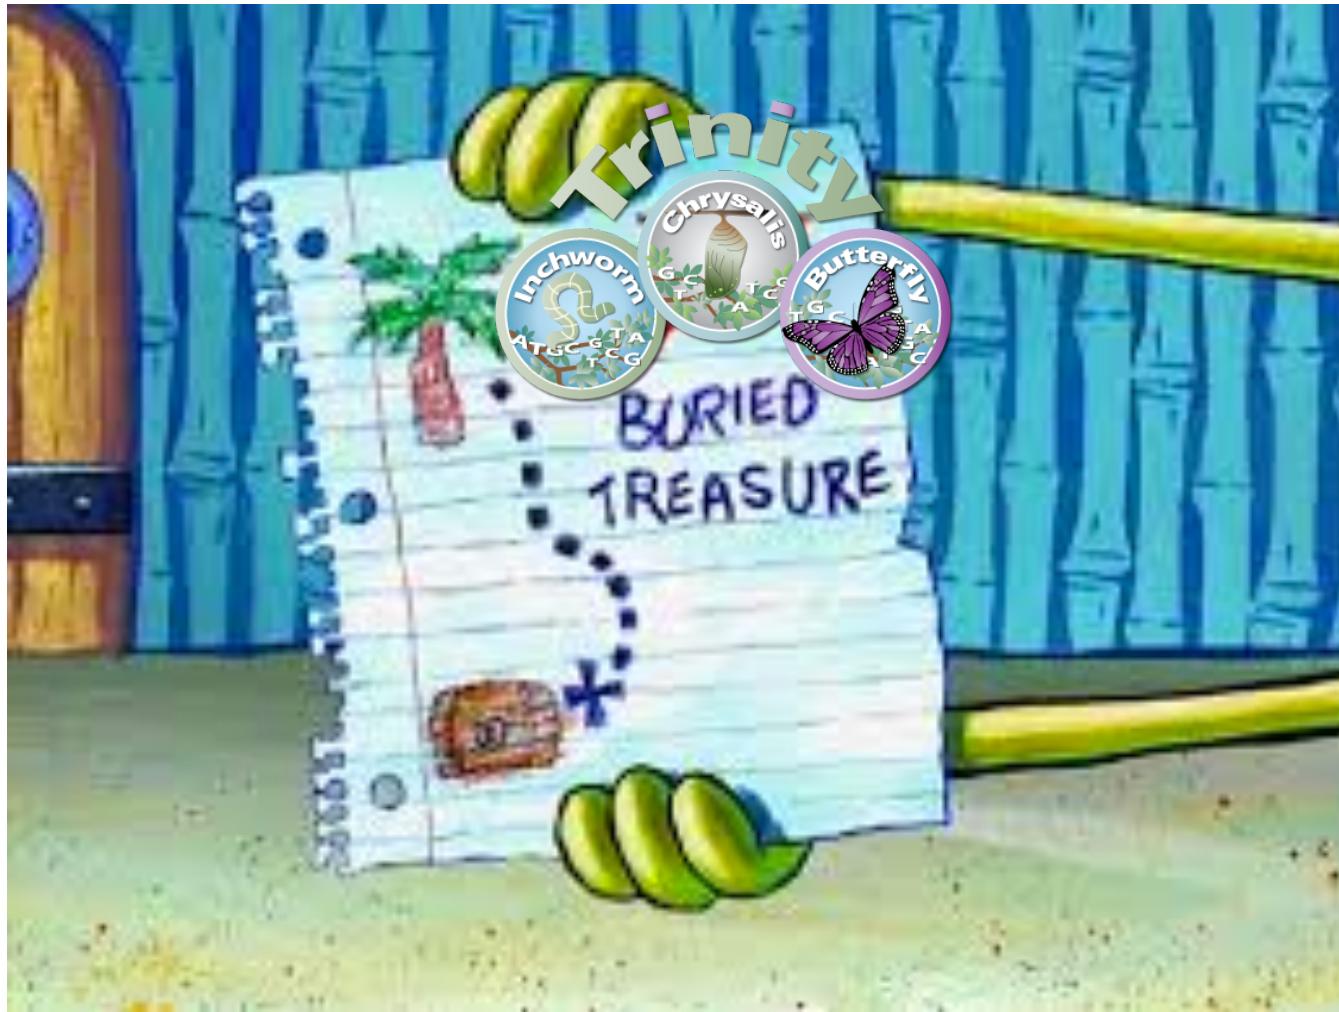

(Krumlov Prelate, 2-5pm)

De novo RNA-Seq Assembly, Annotation, and Analysis Using Trinity and Trinotate

The following details the steps involved in:

- Generating a Trinity de novo RNA-Seq assembly
- Evaluating the quality of the assembly
- Quantifying transcript expression levels
- Identifying differentially expressed (DE) transcripts
- Functionally annotating transcripts using Trinotate and predicting coding regions using TransDecoder
- Examining functional enrichments for DE transcripts using GOseq
- Interactively Exploring annotations and expression data via TrinotateWeb

Trinity Treasure Hunt!!! 😊

Will provide link to the challenge via slack – stay tuned, will start ~ 4pm
